OpenFabrics.org

Revision	Release Date		
0.50	Apr 4, 2006	•	First FrameMaker Draft of the Interop Test Plan which was used in the March 2006 IBTA-OpenFabrics Plugfest.
0.51	Apr 25, 2006	•	Added DAPL and updated MPI.
0.511	June 1, 2006	•	Arkady Added iWARP.
).52	May 30, 2006	•	Added Intel MPI.
0.53	June 6, 2006	•	Updated uDAPL section provided by Arkady.
).54	June 13, 2006	•	Updated entire Test Spec based on changes made by Arkady to incorporate iWARP into the Test Spec.
0.80	June 14, 2006	•	Updated for the OFA conference in Paris and for BoD meeting. Added OFA logo and URL.
1.0	June 21, 2006	•	Released after review and approval at the OFA conference in Paris.
1.01	Aug 17, 2006	•	Updated the iWARP Equipment requirements in the General System Setup section.
1.02	Oct 31, 2006	•	Updated Table 4 for iSER, Table 5 for SRP, Table 10 for uDAPL and corresponding info in Tables 17,18 and 22 as per request by Arkady.
		•	Added new test section from Bob Jaworski for Fibre Channel Gateway.
1.03	Dec 10, 2006	•	Updated test procedures based on the October 2006 OFA Interop Event.
		•	Updated Fibre Channel Gateway test based on changes submitted by Karun Sharma (QLogic).
		•	Added Ethernet Gateway test written by Karun Sharma (QLogic).
1.04	Mar 6, 2007	•	Updated test procedures in preparation for the April 2007 OFA Interop Event
1.05	Mar 7, 2007	•	Updated iWARP test procedures based on review by Mik- kel Hagen of UNH-IOL. Added missing results tables.
1.06	April 3, 2007	•	Updated for April 2007 Interop Event based on review from OFA IWG Meeting on 3/27/07.
1.07	April 3, 2007	•	Updated for April 2007 Interop Event based on review from OFA IWG Meeting on 4/3/07
1.08	April 4, 2007	•	Added list of Mandatory Tests for April 2007 Interop Event.
1.09	April 9, 2007	•	Updated Intel MPI based on review by Arlin Davis.
1.10	April 10, 2007	•	Updated after final review by Arlin Davis and after the OFA IWG meeting on 4/10/2007

Revision History

Revision	Release Date	
1.11	Sep 7, 2007	 Updated with the latest scripts developed by UNH IOL and based on the results from the April 2007 Interop Event
1.12	Sep 12, 2007	Updated the documents to embed the test scripts in the document.
1.13	Jan 22, 2008	• Updated the documents for the March 2008 OFA Interop event. IPoIB updated along with Cover Page and the Test Requirements section.
1.14	Feb 11, 2008	Added the following tests:
		1. Ethernet Switch Tests
		2. IPoIB Connected Mode
		3. RDMA Interop
		• 4. RDS
.15	Feb 18, 2008	Updates to the following tests:
		1. Ethernet Switch Tests
		2. IPoIB Connected Mode
		• 3. RDMA Interop
.16	Feb 25, 2008	• Removed all reference to Low Latency Ethernet Switches. This is the version for the March 2008 Interop Event
.17	March 3, 2008	Added HP-MPI
.18	July 22, 2008	Updated HP-MPI based on results from the March 2008 Interop Event
.19	July 28, 2008	Updated HP-MPI URL for the tests.
		Added section for Open MPI
		Updated MPI based on feedback from UNH IOL
.20	July 30, 2008	Updated section for Open MPI and added tables
		Updated IB SM Failover as per Nick Wood
.21	Aug 1, 2008	• Updated SRP call srp_daemon -o -e -n
		Updated IB SM Failover as Bob Jaworski
		Updated HP-MPI
		Updated Intel MPI
		Updated Open MPI
.22	Aug 29, 2008	Added a section for MVAPICH 1 under OSU MPI
1.23	Feb 16, 2009	Updated Link Init, Fabric Init, SRP, SDP, IPoIB CM, IPoIB DM based on updates received from UNH-IOL

Revision	Release Date	
.24	Feb 23, 2009	Updated Intel MPI and Open MPI to reflect the fact that they are not intended to work in a heterogeneous environment.
		Updated the RDS test procedure
		Updated the Test Glossary
		Updated the Mandatory test table for April 2009
5	Feb 24, 2009	Updated the RDS Test after review by the OFA IWG group.
26	Mar 13, 2009	Restructured entire document to accommodate WinOF and OFED
		Added NFS over RDMA to the test plan.
		Added WinOF tests
		Updated HP-MPI
		Add List of Contributors
7	Mar 17, 2009	Updates based on the review from the OFA IWG
1.28	Mar 27, 2009	Added links in Chapter 10 to the InfiniBand Test Scripts
		Added links to HP-MPI installation Packages
	Aug 25, 2009	Editorial & Technical updates based on April 2009 Interop Event.
		Updated Mandatory tests for October 2009.
		Added Topology Check
		Added new Firmware Policy
0	Sep 4, 2009	Updated Mandatory iWARP tests and several comments based on the review from Harry Cropper
		 Added changes suggested by Jess Robel from QLogic to IPoIB DM and CM and Fabric Init.
31	April 6, 2010	Added definition of homogenous to Test Glossary
		Added updates from the November 2009 Interop Event
2	April 20, 2010	Updated after the OFA IWG meeting on 4/6/2010
		 Updated MPI and MVAPICH based on changes request- ed by Jeff Laird and Intel
33	April 23, 2010	Major changes to Section 8 which describes the Software and Firmware polices
34	July 20, 2010	 Changed uDAPL for iWARP to Beta for Aug 2010 GA Event
		Removed HP MPI which is no longer supported
		 Added -mca mpi_leave_pinned 0 for OpenMPI
		• Add new parameters for MVAPICH2 for iWARP devices.

OFA Interoperability Working Group OFA-IWG INTEROPERABILITY TEST PLAN

Revision	Release Date	
.35	July 27, 2010	Added new parameters for MVAPICH2 for iWARP devic- es. The parameter is: MV2_USE_RDMA_CM=1
.36	Feb 22, 2011	Added Link Init section as per changes provided by Chris Hutchins and approved by OFA IWG.
		• Updated Test Plan Status for April 2011 and October 2011
		Nick Wood from UNH-IOL updated NFSoRDMA
		• Marty requested that we update SRP Results Table 6 and remove the disconnect commands.
37	Oct 4, 2011	Updated Test Plan Status for November 2011
		Added new Test Table for OS and OFED versions
		Nick Wood updated Link Init for IB
		Chris Hutchins updated RDMA Interop and RDMA Stress
		Removed XANSation testing
38	Oct 11, 2011	Changed Link Init Section from Recommendation to MOI
		Updated Section 8 for Firmware, Software and Hardware Policies to bring in line with Logo Program Document
		Updated InfiniBand Test Table 24
39	Oct 24, 2011	Updated Open MPI as per changes submitted by Nick Wood
		 Updated RDMA Interop small test: drop iterations from 100000 to 25000
		 Updated RDMA Interop large test, increase iterations from 100 to 300
		 Updated IPoIB Part A:, drop iterations (number of pings) from 100 to 10.
40	Oct 25, 2011	Modified the following sections
		• 12.6.9 iwarp client 100000 -> 25000
		• 12.6.13
		 olarge read client 65536 -> 1000000
		 olarge write client 65536 -> 1000000
		Added large send command (section c)

39 40

Revision	Release Date	
1	Mar 20, 2012	General Instructions: Added note that the OpenSM will be used to run all mandatory tests in the test plan and the Vendor SM testing will include testing IPoIB, RDMA In- terop and Open MPI testing.
		• General Instructions: The OFILG decided as of April 2012 that the various ULPs contained in this test plan will only be tested if it is supported by the Operating System.
		 Logo Program Requirements: updated IB and iWARP. Made NFSoRDMA Mandatory and MVAPICH Optional.
		• IPoIB: Modified the way IPoIB is set to connected or data- gram mode
		• IPoIB: Changed the ping interval in IPoIB tests from 0.01 to 0.2
		IPoIB: Reduced number of frame sizes tested in the Ping Test.
		MVAPICH: Made testing of MVAPICH 1 & 2 Optional
		NFSoRDMA: Eliminate the need to specify nfs-utils in the NFSoRDMA installation section
		 NFSoRDMA: Changed the way the servers are mounted in NFSoRDMA
		• SDP: Eliminated the need for vsftpd in SDP
		 SDP: Eliminated the environment variables section in SDP
		 SDP: Changed the way the netperf server is started in SDP
		 SDP: Made SDP mandatory only for those Operating Systems that support it.
		• SRP: Mandated that Targets only advertise two volumes in order to reduce the amount of time required to run the tests
.42	Apr 3, 2012	Updated Ethernet Test requirements to move NFSoRDMA to Beta for April 2012
		 Changed the status of Intel MPI and OSU MVAPICH to deprecated meaning the tests are no longer being run or supported.
		Updated SRP notes as per Marty Schlining
43	Aug 14, 2012	 Updated the definition for \$NP in MVAPICH section 12.10.2, 2, ii
		 Updated Mandatory test tables for iWARP and IB
		Cleared all change bars for October 2012 Interop event

40 41

Revision	Release Date	
1	Sep 18, 2012	Removed Intel MPI because it is not Open Source
		Removed SDP because no longer supported in OFED
		 Removed Ethernet Fabric Initialize, Failover and reconvergence. No longer applicable given DCB etc.
		Removed TI RDS for iWARP because RDS does not sup- port iWARP
		Remove iWARP Connectivity - replaced by RDMA Interop test section
		Added section 8 for OS Installation and OS Policy
	Oct 9, 2012	Add second test of SRP
		Add RoCE test sections
3	Dec 17 2012	Added note about NetApp Targets to SRP section
		Added Ubuntu notes to section 9.2.2.1
		Added Ubuntu notes to section 11.2.2 Fabric Init
		Added Ubuntu notes to section 11.6 SRP
		Added Ubuntu notes to section 13.2.1 NFSoRDMA
		Added Ubuntu notes to section 13.3.1 RDS
		Added Ubuntu notes to section 13.5 RDMA Basic Interop
		Added Ubuntu notes to section 13.5 RDMA Stress Test
-v2	Mar 26,2013	Updated the requirements for the OFILP for April 2013
		RoCE Updates suggested by IBM
		 Updated Section 9 regarding the OS and OFED
		 Added RoCE Stress Test to Table 16 and updated Section 13.6 RDMA Stress test
		Added RSockets to the list of tests for future adoption
		 Added IPv6 to the list of tests for future adoption
		 Added Bonding for RoCE Ethernet interfaces to the list of tests for future adoption
-v3	April 16, 2013	 Updated section 3.1 of the uDAPL test plan as per sug- gestion from Nate Landolt (UNH-IOL). Changed second RR to RW
3-v2	May 21, 2013	Corrected typo in 13.5.12 - Nate Rubin
		Added Open MPI Command line for RoCE as reported by Jeff Kopko from Emulex in 13.7.6
		• Updated RDMA Basic Interop Tests for Emulex. Specified the max depth to be -t 127. See Sections 13.5.9, 13.5.11, 13.5.13
		 Added section 13.7.2 on how to Install Open MPI for OFED 3.5 and later
		 Added section 13.7.3 on how to configure and build Open MPI 1.6.x for PowerLinux systems

Revision	Release Date	
1.48-v3	May 22, 2013	Changed max depth to 126 for Emulex cards in section 13.5.xx
		 Addedmca btl openib,self to the PowerLinux com- mand line in section 13.7.6
		Updated Topology Diagrams for IB, iWARP and RoCE
1.48-v4	May 23, 2013	• Updated the language in Sections 13.7.1-9 and 13.7.4-3 as per feedback from Brad Benton.
1.49-v1	Aug 11 2013	Updated the mandatory requirements for IB, iWARP and ROCE.
1.49-v2	Aug 13 2013	Updated the description of the Emulex ROCE hardware as per the request of Jeff Kopko.
1.49-v3	Sep 9, 2013	Updated the NFSoRDMA Section as per the notes from Nate Rubin of UNH-IOL
1.49-v4	Sep 24, 2013	Updated the RSockets Section as per the notes from Nate Rubin of UNH-IOL

InfiniBand Only - Test Overview RELEASE 1.49

1.4 INFINIBAND ONLY - TEST OVERVIEW 1 2 The tables below list all of the specific test procedures for InfiniBand Devices. See the Transport Independent section for tests that apply to all transports. 3 4 5 Table 1 - IB Link Initialize 6 7 Test Description Test # 8 1 Phy link up all ports Check that all relevant LEDs are on for all HCAs and switches. 9 10 11 12 Table 2 - IB Fabric Initialization 13 Test Description Test # 14 15 1 Fabric Initialization Run SM from each node in cluster and see that all ports are in Armed or Active state. 16 Table 3 - IB IPoIB - Connect Mode (CM) 17 18 Test Description Test # 19 20 1 Ping all to all Run SM from one of the nodes and check all nodes responding. Repeat with all SMs. 21 2 Connect disconnect host Run SM from one of the nodes and check all nodes responding. 22 3 FTP Procedure Using a 4MB test file, put the file, then get the file and finally compare the file. 23 24 25 Table 4 - IB IPoIB - Datagram Mode (DM) 26 27 Test Description Test # 28 Ping all to all 1 Run SM from one of the nodes and check all nodes responding. Repeat with all SMs. 29

Table 5 - IB SM Tests

Run SM from one of the nodes and check all nodes responding.

Using a 4MB test file, put the file, then get the file and finally compare the file.

			38
Test #	Test	Description	39
1	Basic sweep test	verify that all SMs are NOT ACTIVE (after receiving the SMSet of SMInfo to DISABLE) and that the selected SM (SM1) is the master (40 41 42

2

3

Connect disconnect host

FTP Procedure

30

31

36

Table 5 - IB SM Tests

Test #	Test	Description
2	SM Priority test	Verify Subnet and SMs behavior according to the SMs priority.
3	Failover - Disable SM1	Disable the master SM and verify that standby SM becomes master and configures the cluster.
4	Failover - Disable SM2	Disable the master SM and verify that standby SM becomes master and configures the cluster.

Table 6 - IB SRP Tests

Test #	Test	Description
1	Basic dd application	Run basic dd application from SRP host connected to target.
2	IB SM kill	Kill the IB master SM while test is running and check that it completes properly.
3	Disconnect Host	Unload SRP Host and check SRP connection properly disconnected.
4	Disconnect Target	Unload SRP Target and check SRP connection properly disconnected.

Table 7 - IB Ethernet Gateway

	Table 7 - ID Ethernet Galeway		
Test #	Test	Description	
1	Basic Setup	Connect the HCA of the IB host and Ethernet Gateway to the IB fabric. Connect the Ethernet gateway to the Ethernet network or Ethernet device. Start the SM to be used in this test.	
2	Start ULP	Determine which ULP your ethernet gateway uses and be sure that ULP is running on the host.	
3	Discover Gateway	Restart the ULP or using the tool provided by the ULP, make sure that the host "discovers" the Ethernet Gateway.	
4	SM Failover	While the ping is running, kill the master SM. Verify that the ping data transfer is unaffected.	
5	Ethernet gateway reboot	Reboot the Ethernet Gateway. After the Ethernet Gateway comes up, verify that the host can discover the Ethernet Gateway as it did before and we are able to configure the interfaces.	
6	ULP restart	Restart the ULP used by Ethernet Gateway and verify that after the ULP comes up, the host can discover the Ethernet Gateway and we are able to configure the interfaces.	
7	Unload/load ULP	Unload the ULP used by Ethernet Gateway and check that the Ethernet Gateway shows it disconnected. Load the ULP and verify that the Ethernet gateway shows the connection.	

Table 8 - IB Fibre Channel Gateway

	Table 6 - ID Fibre Chamiel Gateway		
Test #	Test	Description	38 39
1	Basic Setup	Connect the HCA of the IB host to the IB fabric. Connect the FC Gateway to the IB Fabric. Connect the FC Gateway to the FC network or FC device. Start the SM to be used in this test.	40 41
2	Configure Gateway	Configure the FC Gateway appropriately (how to do this is vendor specific).	41

Test #	Test	Description
3	Add Storage Device	Use ibsrpdm tool in order to have the host "see" the FC storage device. Add the storage device as target.
4	Basic dd application	Run basic dd application from SRP host connected to target.
5	IB SM kill	Kill the IB master SM while test is running and check that it completes properly.
6	Disconnect Host/Target	Unload the SRP host / SRP Target (target first/host first) and check that the SRP connection is properly disconnected.
7	Load Host/Target	Load the SRP host / SRP Target. Using ibsrpdm, add the target.
8	dd after SRP Host and Target reloaded	Run basic dd application from the SRP host to the FC storage device.
9	Reboot Gateway	Reboot the FC Gateway. After FC Gateway comes up, verify using ibsrpdm tool that the host see the FC storage device. Add the storage device as target.
10	dd after FC Gateway reboot	Verify basic dd works after rebooting Gateway.

 Table 8 - IB Fibre Channel Gateway

Ethernet Only - Test Overview RELEASE 1.49

1.5 ETHERNET ONLY - TEST OVERVIEW

The tables below list all of the specific test procedures for iWARP and Ethernet2Devices. See the Transport Independent section for tests that apply to all transports.3

Table 9 - iWARP Link Initialize

Test #	Test	Description	
1	Phy link up all ports	Check that all relevant green LEDs are on for all RN ICs and switches.	
2	Verify basic IP connectiv- ity	Verify IP and RDMA connectivity can occur by driving minimum size ICMP echo requests and replies across the link or equivalent traffic.	

Table 10 - RoCE Link Initialize

Test #	Test	Description
1	Phy link up all ports	Check that all relevant green LEDs are on for all RCAs and switches.
2	Verify basic IP connectiv- ity	Verify IP and RDMA connectivity can occur by driving minimum size ICMP echo requests and replies across the link or equivalent traffic.

37 38

1.6 TRANSPORT INDEPENDENT - TEST OVERVIEW

The tables below list the test procedures that apply to devices regardless of the 2 transport.

Table 11 - TI iSER

Test #	Test	Description
1	Basic dd application	Run basic dd application from iSER host connected to target.
2	IB SM kill	[IB Specific] - Kill the IB master SM while test is running and check that it completes properly.
3	Disconnect Initiator	Unload iSER Host and check iSER connection properly disconnected.
4	Disconnect Target	Unload iSER Target and check iSER connection properly disconnected.
5	Repeat with previous SM Slave	[IB Specific Test] Repeat steps 1-4 now with the previous slave SM (we did not actually stop the target).

Table 12 - TI NFS Over RDMA

Test #	Test	Description
1	File and directory creation	A total of six files and six directories are created
2	File and directory removal	removes the directory tree that was just created by test1
3	Lookups across mount point	changes directory to the test directory and gets the file status of the working directory
4	Setattr, getattr, and lookup	Permissions are changed (chmod) and the file status is retrieved (stat) for each file
5	Read and write	Creates a file (creat), Gets status of file (fstat), Checks size of file, Writes 1048576 bytes into the file (write) in 8192 byte buffers, Closes file (close), Gets status of file (stat), Checks the size of the file
6	Readdir	The program creates 200 files (creat). The current directory is opened (opendir), the begin- ning is found (rewinddir), and the directory is read (readdir) in a loop until the end is found
7	Link and rename	This program creates ten files. For each of these files, the file is renamed (rename) and file statistics are retrieved (stat) for both the new and old names
8	Symlink and readlink	This program makes 10 symlinks (symlink). It reads (readlink), and gets statistics for (lstat) each, and then removes them (unlink).
9	Statfs	This program changes directory to the test directory (chdir and/or mkdir) and gets the file system status on the current directory (statfs).

Table 13 - TI RDS

	Table 15 - 11 KDS		39
Test #	Test	Description	40
1	rds-ping procedure	Run rds-ping and verify that you can reach all hosts in the cluster	41 42

Table 13 - TI RDS

Test #	Test	Description
2	rds-stress procedure	Set up passive receiving instance and an active sender and verify data is exchanged without error

Table 14 - TI uDAPL

Test #	Test	Description	
1	Point-to-Point Topology	Connection and simple send receive.	
2	Point-to-Point Topology	Verification, polling and scatter gather list.	
3	Switched Topology	Verification and private data.	
4	Switched Topology	Add multiple endpoints, polling, and scatter gather list.	
5	Switched Topology	Add RDMA Write.	
6	Switched Topology	Add RDMA Read.	
7	Multiple Switches	Multiple threads, RDMA Read, and RDMA Write.	
8	Multiple Switches	Pipeline test with RDMA Write and scatter gather list.	
9	Multiple Switches	Pipeline with RDMA Read.	
10	Multiple Switches	Multiple switches.	

Table 15 - RDMA Basic Interop

Test #	Test	Description		
1	Small RDMA READ	Create an RDMA command sequence to send a READ operation of one byte.		
2	Large RDMA READ	Create an RDMA command sequence to send a READ operation of 10,000,000 bytes		
3	Small RDMA Write	Create an RDMA command sequence to send a Write operation of one byte	ation of one byte	
4	Large RDMA Write	Create an RDMA command sequence to send a Write operation of 10,000,000 bytes		
5	Small RDMA SEND	Create an RDMA command sequence to send a SEND operation of one byte.		
6	Large RDMA SEND	Create an RDMA command sequence to send a SEND operation of one million bytes		
7	Small RDMA Verify	Create an RDMA command sequence to send a VERIFY operation of one byte.		
8	Large RDMA Verify	Create an RDMA command sequence to send a VERIFY operation of 10,000,000 bytes		

Table 16 - RDMA Stress Tests

Test #	Test	Description
1	Switch Load	For one pair of endpoints generate a stream of RDMA READ operation in one direction and RDMA write operations in the opposite direction. For all remaining endpoint pairs configure an RDMA WRITE operation of 1 byte and have it sent 10000 times on both streams of the endpoint pair.
2	Switch Fan In Connect all possible endpoint pairs such that data exchanges between pairs must traverse the of ports interconnecting the switch	
3	RoCE Stress Test	Stress the RoCE adapter by simultaneously transmitting both RoCE/IB traffic and IP level Ethernet traffic

Table 17 - RSockets

Test #	Test	Description	
1	Socket calls	For each client, run socket tests for all size transfers rstream -s <server-ip-address> -T s -S all</server-ip-address>	
2	Asynchronous calls	For each client run asynchronous tests for all size transfers rstream -s <server-ip-address> -T a -S all</server-ip-address>	
3	Blocking calls	For each client run blocking tests for all size transfers rstream -s <server-ip-address> -T b -S all</server-ip-address>	
4	Non-blocking calls	For each client run blocking tests for all size transfers rstream -s <server-ip-address> -T n -S all</server-ip-address>	
5	Verified transfers	For each client run blocking tests for all size transfers rstream -s <server-ip-address> -T v -S all</server-ip-address>

1.12 HOMOGENOUS VERSUS HETEROGENEOUS

Heterogeneous & homogeneous clusters are the same with one exception: the end points must be from the same vendor in homogeneous clusters. The table below defines the guidelines for building homogeneous and heterogeneous clusters

Description	Homogenous	Heterogeneous
Mixing switches (both models and vendor products)	Encouraged	Encouraged
The use of any InfiniBand subnet manager	Encouraged	Encouraged
All devices of the same model number shall use the same firmware.	Mandatory	Mandatory
Any mix of products from the same vendor is acceptable - e.g. differ- ent model HCAs	Encouraged	Encouraged
A mix of end points (HCA/RNIC) from different OFA vendors	Prohibited	Mandatory
Mixing x86-32 (ix86) and x86_64 Operating System - see notes	Not-Tested	Not-Tested
32 bit architecture and 32 bit OS - see notes	Not-Tested	Not-Tested
Mixing x86-32 and x86-64 user-level application	Optional	Optional
Mixed system architecture - x86 servers mixed with IA-64 (Itanium) servers	Not-Tested	Not-Tested
Mixed system architecture - x86_64 and ppc64 interoperability - this is only tested with IBM RoCE Adapters	Optional	Optional
Mixing endianness in system OS - this is only tested using ppc64 and IBM RoCE Adapters	Optional	Optional
Mixing the quantity of server RAM installed on the hosts	Encouraged	Encouraged
Mixing the server clock speeds	Encouraged	Encouraged
Mixing the number of server cores	Encouraged	Encouraged
Mixing PCIe generations	Encouraged	Encouraged
All servers shall run the same OFED version.	Encouraged	Encouraged
Mixing supported Operating Systems	Encouraged	Encouraged

Notes: Intel drivers do not support 32 bit operating systems

Use of OpenFabrics Software for Pre-Testing RELEASE 1.49

2 Use of OpenFabrics Software for Pre-Testing		
Depending on the schedule of testing and bugs or issues encountered, different snapshots of latest OpenFabrics software will be used during pre-testing prior to		2
	the Interoperability Event. Any changes that result in the OpenFabrics software from interoperability testing per this test plan will be deposited back into the OpenFabrics repository so that the OpenFabrics development community will have full access to any bug fixes or feature additions that may result out of this	
	testing effort. The frequency of such deposits will be determined based on com- pletion of adequate testing of the said fixes or feature additions.	5
3 USE OF OPENFABRICS SOFT	WARE FOR IBTA/CIWG COMPLIANCE PLUGFESTS	6
	During the pre-testing phase, UNH-IOL will apply all reasonable effort to ensure that the OpenFabrics source and binary repositories are up-to-date with the lat-	7
	est OFED release. This will enable cable interoperability testing at plugfests to be conducted using software directly sourced from the OpenFabrics tree.	8
	Should there be any issues with the OpenFabrics community not accepting cer-	9
	tain bug fixes or features with the time frames matching with Compliance Events, UNH-IOL will inform all participants about the same and offer those bug	10
	fixes or features in source code and binary formats directly to the participants and InfiniBand solution suppliers.	11
		12
4 USE OF OPENFABRICS SOFT	WARE FOR OFA IWG INTEROPERABILITY EVENTS	13
	During the pre-testing phase, UNH-IOL will apply all reasonable effort to ensure that the OpenFabrics source and binary repositories are up-to-date with the latest OFED releases chosen by the OFA IWG for use in the Interoperability Event.	14 15
	Should there be any issues with the OpenFabrics community not accepting cer-	16
	tain bug fixes or features with the time frames matching with Interoperability Events, UNH-IOL will inform all participants about the same and offer those bug fixes or features in source code and binary formats directly to the participants	17
	and InfiniBand solution suppliers.	18

25

26 27 28

29

30

5 GENERAL SYSTEM SETUP Configuration

The test environment for the user interface contains:

5.1 IB HW UNITS

Table 25- IB Equipment

Equipment	Amount	Details	Check
Servers with OS installed	12 or more	The OS should be supported by OpenFabrics Software.	
4X IB Cables	30 or more	Between 1 meter => 10 meters.	
IB Switches	4	The number and types of switches needed from member com- panies or OEMs is dependent on variations in subnet manage- ment and other IBTA defined management software. For example if the software on Switch A is different from the software used in Switch B, both Switches will be needed. Note that it is not dependent on number of ports supported by a switch.	
IB HCAs	12 or more		

5.2 IB SOFTWARE

5.2.1 LINUX/WINDOWS PLATFORMS
5.2.2 OFED - MOST CURRENT TESTED RELEASE
5.2.3 IB HCA FW – VERSION XXX - VENDOR SPECIFIC
5.2.4 IB SWITCH FW CANDIDATE - VERSION XXX - VENDOR SPECIFIC

5.2.5 IB SWITCH SW – VERSION XXX - VENDOR SPECIFIC

5.3 IWARP HW UNITS

Table 26 - iWARP Equipment

Equipment	Amount	Details	Check
Servers with OS installed	5 or more	The OS should be supported by OpenFabrics Software.	
4X CX4 or SFP Cables	10 or more	Between 1 meter => 10 meters.	
10 GbE Switches	1	At least one 10 GbE switch must be made available to support the various RNICs in the Fabric There is no need to have multiple switches if there are enough ports on the primary switches to support all the devices in the fabric.	
iWARP RNIC	5 or more	Each vendor must supply 5 or more RNICs in order to support MPI testing.	

5.4 IWARP SOFTWARE 2 5.4.1 LINUX PLATFORMS 3 5.4.2 OFED - MOST CURRENT TESTED RELEASE 4 5.4.3 IWARP RNIC FW - VERSION XXX - VENDOR SPECIFIC 5 5.4.4 10GBE SWITCH FW CANDIDATE - VERSION XXX - VENDOR SPECIFIC 6 5.4.5 10GBE SWITCH SW - VERSION XXX - VENDOR SPECIFIC 7 **5.4.6 VENDOR SPECIFIC NOTES** 8 9 **Note**: Currently there is no interoperability between cxgb4 and nes if peer2peer is enabled. Both nes and cxgb4 have their own proprietary ways of doing "client must send the first 10 fpdu". The Chelsio parameter file /sys/module/iw cxgb4/parameters/peer2peer should be 11 modified on all hosts to contain the appropriate value for each test. For example: the value 12 must be set to '1' for the uDAPL test. 13 14 Arlin Davis suggests the following given the current situation: 15 1)The dapltest -T P (performance tests) will always send data from server side first. This test will 16 NOT work reliably with iWARP vendors. 17 2)The dapltest -T T (transaction tests) should work fine with both IB and iWARP vendors given 18 that it always sends from client side first. 19 3)I recommend using only dapItest transaction mode (-T T) in your test plan and removing -T P 20 mode tests. 21 **5.5 ROCE HW UNITS** 22 Table 27 - RoCE Equipment 23 24 Amount Details Check Equipment 25 Servers with OS installed 5 or more The OS should be supported by OpenFabrics Software. 26 27 4X QSFP+ Cables 10 or more Between 1 meter \Rightarrow 10 meters. 28 **GbE DCB Switches** 1 At least one 10 or 40 GbE DCB switch must be made avail-29 able to support the various RCAs in the Fabric. There is no need to have multiple switches if there are enough ports on 30

5 or more

Switch 1	Switch 2 Switch 3	Switch 4	

7 IWARP HW DESCRIPTION & CONNECTIVITY

7.1 IWARP BASIC CONNECTIVITY (P1P1)

7.1.1 RNIC 1 ON ONE HOST SHOULD BE DIRECTLY CONNECTED TO RNIC 2 ON ANOTHER HOST OR TO A 10GBE SWITCH.

7.1.2 WITH 10GBE CABLES

7.2 SWITCHES AND SOFTWARE NEEDED

7.2.1 SWITCHES PROVIDED BY OEMS

It is necessary that Switches provided by OEMs cover the full breadth of software versions supported by the Switch OEMs. Port count is not critical for the tests. It is recommended that OEMs provide a switch per variations of software supported on the Switch.

7.2.2 OPENFABRICS SOFTWARE RUNNING ON RNICS

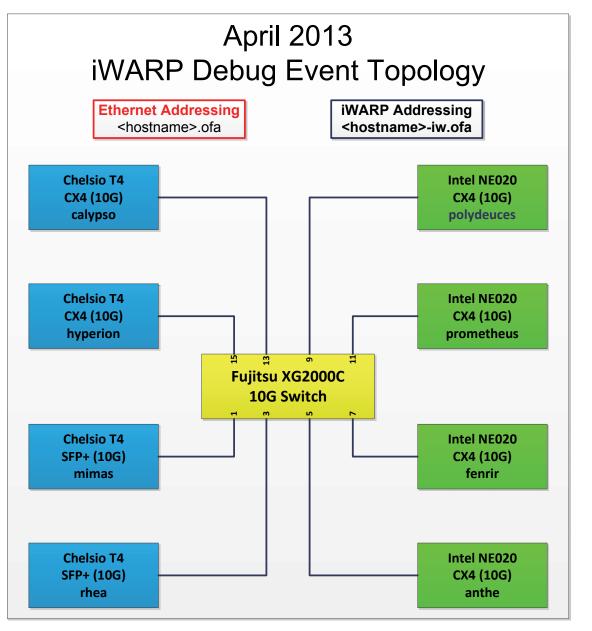

Where there are dependencies of OEM provided with OpenFabrics software running on RNICs, such software should be provided to UNH-IOL for interoperability testing, and any known dependencies should be communicated to UNH-IOL.

OFA Interoperability Working Group	iWARP Fabric Connectivity	September 24, 2013

8 ROCE HW DESCRIPTION & CONNECTIVITY		1
8.1 ROCE BASIC CONNECTIVITY (P1P1)		2
8.1.1 RCA 1 ON ONE HOST SHOULD BE DIRECTLY CONNECTED TO RCA 2 ON ANOTHER HOST OR TO A 10/40 GBE SWITCH DCB ENABLED.		3
		4
8.1.2 CONNECTED WITH 10/40 GBE CABLES		5
8.2 Switches and Software Needed		6 7
8.2.1 SWITCHES PROVIDED BY OEMS		8
	RoCE testing was introduced as of October 2012 and the choice of Ethernet Fab- rics such as Fabric Path, QFabric, MLAG, SPB, TRILL and others are initially not being addressed. This allows us to start Beta Testing RoCE with just one 10/40	9 10
	GbE Ethernet Switch which is DCB enabled. In future Interop events we will con	11
	sider using multiple switches from vendors such as Brocade, Cisco, Extreme, HP, Mellanox and others which will allow us to test various Ethernet Fabric solutions.	12
		13 14
8.2.2 OPENFABRICS SOFTWARE RUNNING ON RCAS		15
	Where there are dependencies of OEM provided with OpenFabrics software run-	16
	ning on RCAs, such software should be provided to UNH-IOL for interoperability testing, and any known dependencies should be communicated to UNH-IOL.	17
		18
8.2.3 ROCE PRIORITY LEVELS		19
	Ethernet provides a construct, called a Priority Level which corresponds concep- tually to InfiniBand's SLs. Eight priorities, numbered zero through seven are sup-	20 21
	ported. As in InfiniBand, a verbs consumer accessing a RoCE port specifies its desired service level, which is then mapped to a given Ethernet Priority. The default mapping is as follows:	22 23
		24
	SL 0-7 are mapped directly to Priorities 0-7 respectively	25
	SL 8-15 are reserved.	26

9 FW & SW INSTALLATION

9.1 BURNING THE FW

9.1.1 FIRMWARE POLICY

Firmware Policy during the Interop Debug Event

The firmware used during the Interop Debug Event is at the discretion of the device vendor. Vendors will be allowed to make changes to the firmware during the Interop Debug Event. However changes should be made as early in the event period as possible to reduce the amount of retesting which will result from these changes.

Firmware Policy during the Interop GA Event

The firmware image used during the Interop GA Event must be provided to the UNH-IOL at least one week prior to the event. No firmware changes of any kind are allowed during the Interop GA Event. If the vendor does not provide updated firmware by the deadline, then the UNH-IOL will use the firmware from the Interop Debug Event or from the vendor's website, whichever is more current.

Firmware Policy after the Interop GA Event

The firmware used to obtain the OFA Logo (or a child of this firmware with the same base functionality) must be the default publicly available firmware on the vendor's website and must be the default firmware that is shipped with the product. This must be completed within six months of the Interop GA Event.

9.1.2 PLEASE REFER TO FIRMWARE BURNING TOOLS AND PROCEDURES DOCUMENTATION FROM HCA IB VENDOR

9.2 OPERATING SYSTEM INSTALLATION

9.2.1 OPERATING SYSTEM POLICY

The OS used during an Interop Debug Event will be determined by the OFA IWG24and will be known as the primary OS. All available updates will be installed prior25to the start of the Interop Debug Event and frozen in place for the duration of the26Interop Debug Event. In the event that some hardware is not supported by the272013 Interop Debug Event, RHEL 6.x will be used for IBM RoCE Adapters since28there are no CentOS, Scientific Linux or Ubuntu distributions for PowerPC platforms.29

The OS used during an Interop GA Event will be the same agreed-upon versions 31 of the OS tested during the Interop Debug Event. The updates applied at the start of the Interop Debug Event will remain frozen in place for the duration of the Interop GA Event. 32

In addition to the mandatory testing performed using the primary OS, beta testing using the secondary operating systems may be performed after completion of mandatory testing. The secondary operating systems are deployed in a similar manner to the primary OS, in that updates are applied at the beginning of the Interop Debug Event and frozen in place for the duration of the Interop GA Event.

OFA Interoperability Working Group	FW & SW installation	September 24, 2013
OFA-IWG INTEROPERABILITY TEST PLAN	Release 1.49	DRAFT

9.2.2 OPERATING SYSTEM INST	ALLATION	
	Install the primary OS on all hosts in the cluster. Use a package manager to up- date all installed packages to their latest versions available as of the start of the Interop Debug Event.	
	Install the secondary operating systems on all hosts in the cluster. Use a package manager to update all installed packages to their latest versions available as of the start of the Interop Debug Event. Install and test as many secondary operating systems as time permits.	
9.2.21 Ubuntu		
	For Ubuntu 12.04 and 12.10 Server edition, run the following commands to en- able the IB interface and then assign the IP address in /etc/network/interfaces	
	 apt-get install ibutils infiniband-diags srptools mpitests 	
	 modprobe mlx4_ib #Mellanox ConnectX cards 	
	modprobe rdma_ucm	
	 modprobe ib_umad 	
	modprobe ib ipoib	
	•	
	Notes:	
	 Most of the commands used here and in the following tests require root- level privileges. Either use 'sudo -i' to simulate a Root login shell or prepend 'sudo' to all the commands. 	
	 The OFED version included in packages and modules available in Ubuntu 12.04 and 12.10 is OFED 1.4.2. 	
3.3 SW INSTALLATION		
0.3.1 SOFTWARE POLICY		
	Software Policy during an Interop Debug Event	
	The software used during an Interop Debug Event will be an agreed-upon RC re- lease of the subsequent OFED version. During the Interop Debug Event vendors	-
	will be allowed to make changes to the software, provided that the changes are	
	based on the same RC release. Vendors are not allowed to extensively modify	
	the software or completely replace it. A vendor supplied version of OFED may be used during the event if the current version of OFED does not include drivers re-	
	quired for a new product. However the vendor must follow the guidelines de-	
	scribed in the OFA Logo Program and make the drivers available within 6 months and include them in the next GA version of OFED.	
	Software Policy during the Interop GA event	
	The software used during an Interop GA Event will be the GA release of the same OFED version as was used during the Interop Debug Event. No software	

OFED version as was used during the Interop Debug Event. No software
changes of any kind are allowed during the Interop GA Event. It is the vendor's
responsibility to ensure that any changes made during the Interop Debug Event
are present in the OFED GA release. Vendors whose products do not use firm-
ware may request that patches be applied to an OFED GA release if that release38

11.1 IB LINK INITIALIZE USING OF	ED F	FOR LINUX	5
11.1.1 Procedure			6
	Sel	ect a pair of devices to test from the created topology	7
		termine the maximum port width and lane speed supported by both de-	8
	vice		9
3)	Sel	ect a cable to use which has been certified for the link parameters deter-	10
		ed by step 2 of section 10.1.1 during an IBTA Plugfest held within the	11
		t 6 months	12
,		connect all IB cables from the selected devices	13
,		utdown all SMs running on the selected devices	14 15
6)		nnect the selected devices back to back using the cable selected during p 3 of section 10.1.1	16
7)	Wa	it for a physical indication that a link has been established	17
8)	Ver	ify that the link created in step 6 of section 10.1.1 has come up with the	18
	par	ameters determined in step 2 of section 10.1.1	19
9)	Re	peat steps 1-8 with a different device pairing	20
	a)	All unique device pairs present in the created topology must be tested; except SRP target to SRP target and gateway to SRP target.	21 22
	b)	Each device must link at the maximum port width and lane speed sup-	23
	,	ported by both devices in all pairings for said device to pass link initial- ization testing	24 25
11.1.2 Method of Implementation for a	all Li	inux OSs	26
•		perform step 7 of section 10.1.1:	27
	a)	Look for link LEDs on the ports you are using	28
2)	,	perform step 8 of section 10.1.1:	29
_,		ssh into a device supporting such remote connections and is running	30
		the OFED stack; usually a compute node with an HCA	31
	b)	Run "ibdiagnet -wt <desired-topology-file-name>"</desired-topology-file-name>	32
	C)	Check the topology file created by the previous command:	33
	,	i) Match the GUIDs to the devices in the selected pair	34
		ii) Verify link width is the highest common denominator of pair capabil-	35
		ities (1x, 4x, 12x)	36 37
		iii) Verify link speed is the highest common denominator of pair capa- bilities (2.5G, 5G, 10G, 14G)	38
3)	То	determine switch to SRP target and switch to switch link parameters	39
	a)	Run the commands outlined by step 2 of section 10.1.2 from a third de-	40
		vice	41
			42

11.2 IB FABRIC INITIALIZATION	USI	NG OFED	1
11.2.1 Architect the Network we w	vant	to build.	2
	1)	Develop a cluster diagram based on the devices that have been submitted for Interop Testing and assign IP addresses to the IPoIB interfaces and the	3
	2)	ethernet management interfaces. See <u>Figure 4- Sample Network Configuration</u> below.	4
11.2.2 Procedure			5
	1)	Connect the HCAs and switches as per the Architected Network and make sure that no SM/SA is running on the Fabric.	6
	,	Start an SM on a device and let it initialize (all SM's will need to be tested) Visually verify that all devices are in the active state. Verify that the LED is	7
			8
		Run "ibdiagnet -pc" to clear all port counters Wait 17 seconds as per the specifications requirements.	9
		Run "ibdiagnet -c 1000" to send 1000 node descriptions. Run "ibdiagnet" to generate fabric report.	10
	,	a) Use /tmp/ibdiagnet.sm file to determine running smb) sminfo can also be used to determine the master SM or saquery -s to	11
		find all SMs. Note : "ibdiagnet -r" seg faulted but was fixed in OFED 1.5 according to	12
	9)	Bug 1618 Run "ibchecknet" to build guid list.	13
		Run "ibdiagnet -t <file>" to compare current topology to the previously gen- erated topology file</file>	14
		Note : For Ubuntu, ibdiagnet -t <tp> requires local system name speci- fied. Use ibstat to find a match and do 'ibdiagnet -s <sys name=""> -t <tp>'.</tp></sys></tp>	15
11.2.3 Verification Procedures			16
The second sec	1)	Review "PM Counters" section of the fabric report. There should be no il-	17
		legal PM counters. The Specification says there should be no errors in 17 seconds.	18
	2)	Review "Subnet Manager " section of the fabric report. Verify that the running SM is the one you started and verify number of nodes and switches	19
	3)	in the fabric. Review the ibchecknet report and verify that there are no duplicate GUIDs in	20
	4)	the fabric Verify that step 10 above indicates that the topology before the test and the	21
		topology after the test are the same.	22
		start all devices in the fabric and follow Sections 10.2.2 and 10.2.3. Run the	23
		I from a different device in the fabric until all SMs present have been used. All Is on managed switches (including those switches running opensm) should	24
	be	tested and at least one instance of opensm on an HCA must be tested. If there HCAs from more than one vendor, then opensm should be run from each	25
		ndor's HCA.	

Each device must pass all verification procedures with every SM to pass Fabric 1 Initialization test.

2

3

4

5

6

7

8

9

10

11

Table 28 - ibdi	agnet commands
Commands	Description
Ibdiagnet -c 1000	Send 1000 node descriptions
ibdiagnet -h	Help
Ibdiagnet -lw 4x - ls 2.5	Specify link width and speed
Ibdiagnet - pc	Clear counters
ibdiagnet -t <file></file>	Compare current topology to saved topology
ibdiagnet -wt	Writes the topology to a file

12 Note: The topology file is being generated after the SM starts but before any testing has started. The topology comparison is being performed after testing has 13 been completed but before the systems get rebooted. A topology check is performed during every part of every test section that does not specifically state 14 "change the topology". For example Fabric Init only has 1 part so there is only 1 check but RDS has 2 parts so 2 checks are performed. However, IPoIB has 3 15 parts for each of 2 modes but 1 of those parts specifically says to change the topology so only 4 checks occur.

			figure IPoIB address. All addresses must reside on the same subnet.	15 16
			Set interfaces to 10.0.0.x/24 (10.0.0.x/netmask 255.255.255.0) using the command <i>ifconfig ib0 10.0.0.x netmask 255.255.255.0</i>	17 18
11.3.3 .BRINGING THE IPOIB IN C	ONN	ECTE	D MODE	19
	1)	echo	o 'connected' > /sys/class/net/ib0/mode	20
	2)		date CM mode by checking that "/sys/class/net/ <i f="" name="">/mode" equal onnected'</i>	21 22
	3)	Rep	eat steps 1-2 in section 10.3.3 on all nodes being tested.	23 24
11.3.4 PING PROCEDURES				25 26
Step A	1)	Stop	all SM's and verify that none are running	20
	2)		er cycle all switches in the fabric (this insures that the new SM will con- e all the links and create the multi-cast join).	28 29
	3)	Star	t an SM (All SM's will need to be tested) and let it initialize	30
			Visually verify that all devices are in the active state. Verify that the LED is on when the port is active.	31 32
			Run "ibdiagnet -r" and verify that the SM you started is the one that is running and and that it is the master. You will need to know the GUID of the device since the SM will be reassigned on each reboot.	33 34 35
		c)	Verify that all nodes and switches were discovered.	36
			Note : Ibdiagnet may show more switches than indicated by the physical number of switch platforms present. This is because some switches have multiple switch chips.	37 38
	4)		mine the arp table (via arp -a) and remove the destination node's ib0 ad- s from the sending node's arp table (via arp -d).	39 40

OFA Interoperability Working Group OFA-IWG INTEROPERABILITY TEST PLAN	IB IPolB Connect Mode (CM) using OFED September 24, 2013 RELEASE 1.49 DRAFT	
	Ping every HCA except localhost with packet sizes of 511, 1025, 2044, 8192, 32768 and 65507.	
	a) ping -i 0.2 -t 3 -c 10 -s <ping size=""> <destination></destination></ping>	
	i) "-i" - interval 0.2 seconds	,
	ii) "-t" - IP Time to Live equals 3 seconds	
	iii) "-c" - count equals 100	
	iv) "-s" - size of the ping	
	v) "destination" - the IP address of the IPoIB interface being pinged.	
	 Repeat step #4 before issuing each ping command. Every packet size is a new ping command. 	
	b) In order to pass Step A, a reply must be received for every ping sent (withou losing a single packet) while using each one of the SMs available in the cluster.	t
Step B) Bring up all HCAs but one.	
	Start an SM (all SMs will need to be tested).	
	3) Check for ping response between all node (All to All).	
	a) A response from the disconnected HCA should not be returned.	
	Disconnect one more HCA from the cluster.	
	 Ping to the newly disconnected HCA from all nodes (No response should be returned). 	-
	Connect the first machine (the one that was not connected) and check for ping response from all nodes that are still connected.	
	 Connect the disconnected HCA to a different switch on the subnet which will change the topology. 	
	B) Ping again from all nodes (this time we should get a response).	
	Follow Step B, this time bring the interface down and then back up using if- config ibX down and ifconfig ibX up commands instead of physically discor necting the HCAs.	
	Note : Each step must exhibit the expected behavior while using each SM ir order for the device to pass Step B overall.	
Step C	Follow Step A and B using a different SM until all SM's have been used. Only one instance of each available SM is required. Steps A, B, and C must pass in orde or the device to pass 10.3.4 overall.	
11.3.5 SFTP PROCEDURE		
	SFTP procedures require an SFTP server to be configured on each machine ir he partner pair. An SFTP client needs to be available on each machine as well he default RHEL install includes both.	
	A 4 MB file will be SFTP'd to the partner and then SFTP'd back and binary com pared to the original file, this will be done in each direction and then bidirectiona using every SM available.	-

21

22 23

11.3.5.1 SETUP		
	1)	Make sure vsftpd is installed on each node for SFTP application.
	2)	A special account for this should be created as follows:
		b) Username: Interop
		c) Password: openfabrics
11.3.5.2 PROCEDURE		
	1)	Run SFTP server on all nodes.
	2)	Start an SM (all SM's will need to be tested) and let it initialize
		a) Verify that the running SM is the one you started.
	3)	SFTP:
		a) Connect an HCA pair via SFTP on IPoIB using the specified user name and password.
		b) Put the 4MB file to the /tmp dir on the remote host.
		c) Get the same file to your local dir again.
		d) Compare the file using the command <i>cmp tfile tfile.orig.</i>
		i) The two must be identical
	4)	Repeat the procedure with a different SM.
		Note : Every node must SFTP the 4MB file to all others using all SM's and the files must be identical as determined by the binary compare in order for the device to pass 10.3.5 overall.
		Note : Sections 10.3.4 and 10.3.5 must pass using the configuration determined by sections 10.3.1, 10.3.2, and 10.3.3 for the device to pass IPoIB Connected mode overall.

	4)	Exa	mine the arp table (via arp -a) and remove the destination node's ib0 ad-	
	-		ss from the sending node's arp table (via arp -d).	
	5)	lssu	e the command: sysctl net.ipv4.neigh.ib0.unres_qlen=33	41
	4)		mine the arp table (via arp -a) and remove the destination node's ib0 ad-	39 40
	5)	Issu	e the command: sysctl net.ipv4.neigh.ib0.unres_qlen=33	41
				+2

		a) This sets the qlen variable to 33 which increases the buffer size so that you do not get an initial dropped packet when using ping sizes 8192 and greater.	1 2 3
	6)	Ping every HCA except localhost with packet sizes of 511, 1025, 2044, 8192, 32768 and 65507.	4 5
		a) ping -i 0.2 -t 3 -c 10 -s <ping size=""> <destination></destination></ping>	6
		i) "-i" - interval 0.2 seconds	7
		ii) "-t" - IP Time to Live equals 3 seconds	8
		iii) "-c" - count equals 100	9
		iv) "-s" - size of the ping	10
		v) "destination" - the IP address of the IPoIB interface being pinged.	11
		b) Repeat step #4 before issuing each ping command. Every packet size is a new ping command.	12 13
	7)	In order to pass Step A, a reply must be received for every ping sent (without losing a single packet) while using each one of the SMs available in the cluster.	14 15 16
Step B	1)	Bring up all HCAs but one.	17
	2)	Start an SM (all SMs will need to be tested).	18
	3)	Check for ping response between all node (All to All).	19
		a) A response from the disconnected HCA should not be returned.	20
	4)	Disconnect one more HCA from the cluster.	21
	5)	Ping to the newly disconnected HCA from all nodes (No response should be returned).	22 23
	6)	Connect the first machine (the one that was not connected) and check for ping response from all nodes that are still connected.	24 25
	7)	Connect the disconnected HCA to a different switch on the subnet which will change the topology.	26 27
	8)	Ping again from all nodes (this time we should get a response).	28
	9)	Follow Step B, this time bring the interface down and then back up using if- config ibX down and ifconfig ibX up commands instead of physically discon-	29 30
		necting the HCAs.	31
		Note : Each step must exhibit the expected behavior while using each SM in order for the device to pass Step B overall.	32 33
Step C	1)	Follow Step A and B using a different SM until all SM's have been used. Only one instance of each available SM is required. Steps A, B, and C must pass in order for the device to pass 10.4.4 overall.	34 35 36
	2)	Issue the command: sysctl net.ipv4.neigh.ib0.unres_qlen=3	37
		a) This sets the glen variable back to the default.	38
11.4.5 SFTP PROCEDURE			39
	SF	IP procedures require an SFTP server to be configured on each machine in	40
	the	partner pair. An SFTP client needs to be available on each machine as well.	41
	The	e default RHEL install includes both.	42

OFA Interoperability Working Group OFA-IWG INTEROPERABILITY TEST PLAN	I	B IPoIB Datagram Mode (DM) using OFED September RELEASE 1.49	24, 2013 DRAFT	_
	par	MB file will be SFTP'd to the partner and then SFTP'd back and ed to the original file, this will be done in each direction and then		1
	usi	ng every SM available.		3
11.4.5.1 SETUP				4
	4)	Make over with disingle large and hands for OFTD and is the	_	5
	1)	Make sure vsftpd is installed on each node for SFTP application	٦.	6
	2)	A special account for this should be created as follows:		1
		b) Username: Interop		8
		c) Password: openfabrics		(
11.4.5.2 PROCEDURE				
	Ru	n SFTP server on all nodes.		,
	1)	Start an SM (all SM's will need to be tested) and let it initialize		
		a) Verify that the running SM is the one you started.		
	2)	SFTP:		
		 Connect an HCA pair via SFTP on IPoIB using the specified and password. 	d user name	
		b) Put the 4MB file to the /tmp dir on the remote host.		
		c) Get the same file to your local dir again.		
		d) Compare the file using the command <i>cmp tfile tfile.orig.</i>		
		i) The two must be identical		
	3)	Repeat the procedure with a different SM.		
	- ,	Note : Every node must SFTP the 4MB file to all others using all s files must be identical as determined by the binary compare in a device to pass 10.4.5 overall.		
		Note: Sections 10.4.4 and 10.4.5 must pass using the configura	ation deter-	
		mined by sections 10.4.1, 10.4.2, and 10.4.3 for the device to p	ass IPolB	
		Datagram mode overall.		

- 41
- 42

11.5 IB SM FAILOVER AND HANDO	VER PROCEDURE USING OFED	1
11.5.1 SETUP		2
1)	Connect HCAs per the selected topology.	3
2)	In this test, all active SMs on the fabric which are going to be tested, must	4
	be from the same vendor. They will be tested pairwise; two at a time.	5
11.5.2 PROCEDURE		6
1)	Disable all SMs in the cluster then start a SM on either machine in a chosen pair.	7 8
2)	Run "saquery" on a node in the fabric.	9
	a) Verify that all nodes in the cluster are present in the output	10 11
3)	Using the ibdiagnet tool with the -r option, verify that the running SM is the master.	12
4)	Start a SM on the second machine in the current pair.	13 14
5)	Verify that the SMs behave according to the SM priority rules. Use "ibdi-	15
	agnet -r" again.	16
	a) SM with highest numerical priority value is master and the other is in	17
	standby.	18
	a) If both SMs have the same priority value then the SM with the smallest guid is master and the other is in standby.	19 20
6)	Run "saquery" on either machine in the current pair.	21
	a) Verify that all nodes in the cluster are present in the output.	22
7)	Shutdown the master SM.	23
8)	Verify the other active SM goes into the master state using "ibdiagnet -r" again.	24 25
9)	Run "saquery" on either machine in the current pair.	26
	a) Verify that all nodes in the cluster are present in the output.	27
10)	Start the SM you just shutdown.	28
11)	Verify that the newly started SM resumes it's position as master while the	29
,	other goes into standby again.	30
12)	Run "saquery" on either machine in the current pair.	31
	a) Verify that all nodes in the cluster are present in the output.	32
13)	Shutdown the standby SM.	33
14)	Verify that the previous master SM is still the master.	34
	Run "saquery" on either machine in the current pair.	35 36
,	a) Verify that all nodes in the cluster are present in the output.	37
16)	Repeat steps 1-15 above 2 more times, ensuring that the below criteria is	38
,	met (total of 3 tests per pair which can be run in any order):	39
	a) First SM to be started having highest numerical priority value.	40
	b) Second SM to be started having highest numerical priority value.	41
		42

c) Both SMs having equal numerical priority values.	1
17) Repeat steps 1-16 until all possible SM pairs from identical vendors in the	2
cluster have been tested.	3
18) All of the "saquery" commands must return the expected list of nodes in order for the SMa in this test to receive a passing grade	4
order for the SMs in this test to receive a passing grade.	5

11.6 IB SRP USING OFED 2 11.6.1 SETUP Edit the file srp daemon.conf and make sure it contains the following line 4 a) "a max sect=65535" 5 2) Connect the HCAs and switches as per the Architected Network and make 6 sure that no SM is running on the Fabric. 7 Note: As of the April 2012 Interop events, one SRP target (i.e.target port) should 8 present 2 or more volumes. All other target ports may be limited to one volume 9 per port. This decision was made in order to reduce the amount of time required to run the tests. 10 11 Note: As of October 2012, the SRP Extended Procedure is a Beta test 12 13 **Note:** NetApp targets only support writing and reading from one controller at a time. Therefore only one controller per device should be attached to the test 14 fabric. The controller that accepts writes is on a per LUN basis, the controller that 15 owns the volume. 16 17 11.6.2 SRP CORE PROCEDURE - MANDATORY 18 1) Start an SM (all SM's will need to be tested) and let it initialize 19 a) Verify that the running SM is the one that you started 20 Choose a node to work with 21 3) Unload the srp module 22 4) Load srp module with cmd sg entries=255 23 a) Example: modprobe ib_srp cmd_sg_entries=255 24 25 b) Let it initialize 26 5) Verify that the module loaded correctly 27 a) Example: Ismod | grep ib srp 28 6) Load srp daemon with -e -o -n options 29 a) Example: srp daemon -e -o -n 30 b) Let it initialize 31 7) Find all volumes from all targets 32 a) Use Isscsi 33 34 Note: As of April 2012, the OFILG mandated that the target only include two volumes when doing mandatory testing. 35 36 Note: For Ubuntu, Isscsi is not installed by default. Please do 'apt-get install Isscsi' to install it. 37 8) Perform 6GB read from srp volume to null 38 39 a) Example: dd if=\$drive of=/dev/null count=600 bs=10M 40 9) Perform 6GB write from zero to srp volume

a) Example: dd if=/dev/zero of=\$drive count=600 bs=10M

41

OFA Interoperability Working Group	IB SRP using OFED	September 24, 2013
OFA-IWG INTEROPERABILITY TEST PLAN	RELEASE 1.49	DRAFT

Note: An HCA must successfully complete all DD operations to and from all 1 volumes on all targets using all available SM's in order to pass SRP testing

11.7 IB ETHERNET GATEWAY USING OFED

11.7.1 PROCEDURE

1)	Connect the HCA of the IB host to the IB fabric. Connect the Ethernet	3
	Gateway to the IB fabric. Connect the Ethernet gateway to the Ethernet net-	2
	work or Ethernet device. Start the SM to be used in this test.	Ę

- 2) Determine which ULP your ethernet gateway uses and be sure that ULP is running on the host (VNIC or IPoIB).
- Restart the ULP or using the tool provided by the ULP, make sure that the host "discovers" the Ethernet Gateway. Configure the interfaces and make sure they are up.
- 4) Run ping from the host to the Ethernet device. While the ping is running, kill the master SM. Verify that the ping data transfer is unaffected.
- 5) Reboot the Ethernet Gateway. After the Ethernet Gateway comes up, verify that the host can discover the Ethernet Gateway as it did before and we are able to configure the interfaces.
- 6) Restart the ULP used by Ethernet Gateway and verify that after the ULP comes up, the host can discover the Ethernet Gateway and we are able to configure the interfaces.
- Unload the ULP used by Ethernet Gateway and check that the Ethernet Gateway shows it disconnected. Load the ULP and verify that the Ethernet gateway shows the connection.
- 8) Repeat step 4 by using ssh and scp instead of ping.

11.8 IB FIBRECHANNEL GATEWAY USING OFED

11.8.1 PROCEDURE

		2
1)	Connect the HCA of the IB host to the IB fabric. Connect the FC Gateway to the IB Fabric (how to do this is determined by the FC Gateway vendor).	3 4
	Connect the FC Gateway to the FC network or FC device. Start the SM to be used in this test.	5
2)		6
2)	Configure the FC Gateway appropriately (how to do this is vendor specific).	7
3)	Use ibsrpdm tool in order to have the host "see" the FC storage device. Add the storage device as target.	8 9
4)	Run basic dd application from the SRP host to the FC storage device.	10
5)	Run basic dd application from the SRP host to the FC storage device. While the test is running, kill the master SM. Verify that the test completes properly.	11 12 13
6)	Unload the SRP host / SRP Target (target first/host first) and check that the SRP connection is properly disconnected.	13 14 15
7)	Load the SRP host / SRP Target. Using ibsrpdm, add the target.	16
8)	Run basic dd application from the SRP host to the FC storage device.	17
9)	Reboot the FC Gateway. After FC Gateway comes up, verify using ibsrpdm tool that the host see the FC storage device. Add the storage device as target.	18 19
10)	Run basic dd application from the SRP host to the FC storage device.	20
	Follow steps 1-10 above with each SM to be tested and with each HCA to be tested, until each HCA and each SM has been tested with the FC Gateway.	21 22 23

12 ETHERNET SPECIFIC INTER)p F	PROCEDURES USING OFED	1
12.1 IWARP LINK INITIALIZE U	SING	GOFED	2
12.1.1 PURPOSE			3
12.1.1 F URFOSE	ть	a WADD Link Initialize test is a validation that all WADD devices respining the	4
		e iWARP Link Initialize test is a validation that all iWARP devices receiving the A Logo can link and pass traffic under nominal (unstressed) conditions.	5
	01		6
12.1.2 RESOURCE REQUIREMENT	S		7
	1)	Gigabit or 10Gigabit iWARP RNIC,	8
	2)	Gigabit or 10Gigabit Ethernet Switch	9
	3)	Compliant Cables	10
12.1.3 DISCUSSION	,		11
12.1.0 Discussion	Th	e validation of the underlying transport infrastructure is essential to the end-	12
		ers experience of the operation of the OFED software stack. To this end, this	13
		t confirms that iWARP devices receiving the OFA Logo can suitably link and	14
		ss traffic in any configuration. Exhaustive compliance testing of BER perfor-	15
		nce of the channel or electrical signaling of the ports is not performed; how- er, successful completion of this test provides further evidence of the	16
		bustness of the OFA logo bearing device.	17
			18
12.1.4 PROCEDURE			19
	1)	Connect the two link partners together utilizing compliant cables.	20
	2)	Check all relevant LEDs on both ends of the link.	21
	3)	Verify that basic IP connectivity can occur by driving minimum size ICMP	22
	,	echo requests and replies across the link or equivalent traffic (including	23
		RDMA traffic if readily configured, in which case an additional RNIC re-	24
		sponder station is required). To verify that an RDMA link has been initialized between Host A and Host B run the following commands:	25
		a) Start a server in verbose mode on Host A:	26
			27
		i) rping -sv	28
		b) Start a client on Host B to ping Host A.	29
		i) rping -cv -a Host A RNIC_IP_Address	30
		c) Optional Command for the client	31
		i) rping -cv -a Host A <i>RNIC_IP_Address</i> -C 4 -S 50	32
		Note: This sends a count of 4 pings and character strings of size 50	33
	4)	Repeat steps 1-3 for all combinations of 2 RNICs to switches, switch to	34
		switch, and RNIC to RNIC link partner combinations. Previously tested com-	35
		binations resident in the OFILG cluster may be omitted.	36
12.1.5 OBSERVABLE RESULTS			37
	1)	Link should be established on both ends of the channel.	38
	2)	Traffic should pass in both directions. Error rates of 10e-5 or better should	39
		be readily confirmed (no lost frames in 10,000).	40
			41

OFA Interoperability Working Group	iWARP Link Initialize using OFED	September 24, 2013
OFA-IWG INTEROPERABILITY TEST PLAN	RELEASE 1.49	DRAFT

1) Traffic directed to a switches IP management address may not be pro-

cessed at high speed, in such cases, traffic should be passed across the switch to a remote responder.

12.1.6 POSSIBLE PROBLEMS

12.2 ROCE LINK INITIALIZE USI	NG	OFED	1
12.2.1 PURPOSE			2
	The	RoCE Link Initialize test is a validation that all RoCE devices receiving the	3
		A Logo can link and pass traffic under nominal (unstressed) conditions.	4
			5
12.2.2 RESOURCE REQUIREMENTS			6
	1)	10 or 40 Gigabit RoCE Channel Adapter (RCA)	7
	2)	10 or 40 Gigabit RoCE Switch (DCB Enabled)	8
	3)	Compliant Cables	9
12.2.3 DISCUSSION			10
		validation of the underlying transport infrastructure is essential to the end-	11 12
		rs experience of the operation of the OFED software stack. To this end, this confirms that RoCE devices receiving the OFA Logo can suitably link and	12
		s traffic in any configuration. Exhaustive compliance testing of BER perfor-	14
		nce of the channel or electrical signaling of the ports is not performed; how-	15
		r, successful completion of this test provides further evidence of the ustness of the OFA logo bearing device.	16
	100		17
12.2.4 PROCEDURE			18
	1)	Connect the two link partners together utilizing compliant cables.	19
	2)	Check all relevant LEDs on both ends of the link.	20
	3)	Verify that basic IP connectivity can occur by driving minimum size ICMP	21
		echo requests and replies across the link or equivalent traffic (including	22
		RDMA traffic if readily configured, in which case an additional RoCE re- sponder station is required). To verify that an RDMA link has been initialized	23
		between Host A and Host B run the following commands:	24
		a) Start a server in verbose mode on Host A:	25
		i) rping -sv -a Host A RCA_IP_Address	26 27
		b) Start a client on Host B to ping Host A.	28
		i) rping -cv -a Host A <i>RCA_IP_Address</i>	29
		c) Optional Command for the client	30
		i) rping -cv -a Host A RCA_IP_Address -C 4 -S 50	31
		Note : This sends a count of 4 pings and character strings of size 50	32
	4)	Repeat steps 1-3 for all combinations of 2 RCAs to switches, switch to	33
		switch, and RCA to RCA link partner combinations. Previously tested combi-	34
		nations resident in the OFILG cluster may be omitted.	35
12.2.5 OBSERVABLE RESULTS			36
	1)	Link should be established on both ends of the channel.	37
	2)	Traffic should pass in both directions. Error rates of 10e-5 or better should	38
		be readily confirmed (no lost frames in 10,000).	39

13.2 TI NFS OVER RDMA USIN 13.2.1 Installation	IG OF	ED	1 2
		Steps 2-4 are unneeded if an OFED supported OS is used along with an OFED release downloaded from http://www.openfabrics.org	3 4
		NFSoRDMA is not installed by default in OFED v.1.4.2 and therefore this not supported by Ubuntu 12-4 and 12-10 server.	5 6 7
		rify that you are using a Linux kernel with NFS/RDMA on every system ed	8 9
	a)	The NFS/RDMA client and server are both included in the mainline Linux kernel version 2.6.25 and later. This and other versions of the 2.6 Linux kernel can be found at: ftp://ftp.kernel.org/pub/linux/kernel/v2.6/	10 11 12
		Note: OFED supported OS releases of lower kernel revision than men- tioned above have been updated by their respected maintainers to allow NFS RDMA to function. Check the nfs-rdma.release-notes.txt provided with the OFED release you are using for supported OS releases.	12 13 14 15
		Note: As of OFED 1.5.3 rc2 NFSoRDMA is not installed by default. To do so you must have built OFED from src with nfsrdma=y directive contained within the ofed.conf file used by the OFED installer.	16 17 18
		i) To generate an ofed.conf file run the following from within the down- loaded OFED src.	19 20
		1. \$./install.pl -p	21
		ii) Add the following directives to the generated ofed-all.conf file	22
		1. nfsrdma=y	23
		iii) Install OFED	24
		1/install.pl -c ofed-all.conf	25
	2) Co	onfigure the RDMA stack on every system used	26
	a)	Make sure your kernel configuration has RDMA support enabled. Under Device Drivers => InfiniBand support, update the kernel configuration to enable InfiniBand support.	27 28 29
		Note : the option name is misleading. Enabling InfiniBand support is required for all RDMA devices (IB, iWARP, etc.).	30 31
	b)	Enable the appropriate IB HCA support (mlx4, mthca, ehca, ipath, qib, etc.) or iWARP adapter support (amso, cxgb3, etc.).	32 33
	c)	If you are using InfiniBand, be sure to enable IP-over-InfiniBand (IPoIB) support.	34 35
	3) Co	onfigure the NFS client	36
	a)	Your kernel configuration must also have NFS file system support	37
		and/or NFS server support enabled. These and other NFS related con- figuration options can be found under File Systems => Network File Systems.	38 39

OFA Interoperability Working Group	TI NFS over RDMA using OFED	September 24, 2013
OFA-IWG INTEROPERABILITY TEST PLAN	RELEASE 1.49	DRAFT

	a)	are turned on. The NFS/RDMA client and server are configured via thidden SUNRPC_XPRT_RDMA config option that depends on SUN RPC and INFINIBAND. The value of SUNRPC_XPRT_RDMA will be							
		i)	- N if either SUNRPC or INFINIBAND are N, in this case the NFS/RDMA client and server will not be built	4 5					
		ii)	- M if both SUNRPC and INFINIBAND are on (M or Y) and at least one is M, in this case the NFS/RDMA client and server will be built as modules	6 7 8					
		iii)	- Y if both SUNRPC and INFINIBAND are Y, in this case the NFS/RDMA client and server will be built into the kernel	9 10					
	b)		ou have followed the steps above and turned on NFS and RDMA, the S/RDMA client and server will be built.	11 12					
	C)	Bui	ld a new kernel, install it and boot it	13					
5)	Ch	eck	RDMA Setup	14					
	a)		ou are using InfiniBand, make sure there is a Subnet Manager (SM) ning on the network.	15 16					
	b)	Us	e IPoIB to ping two hosts.	17					
6)	Со	nfigu	ire NFS exports, start NFS server	18					
	a)	Us	e two machines, one to act as the client and one to act as the server.	19					
	b)	NF	the server system, configure the /etc/exports file and start the S/RDMA server. Export entries with the following formats have been ted:	20 21 22					
		i)	/vol0 192.168.0.47(fsid=0,rw,async,insecure,no_root_squash)	23					
		ii)	/vol0 192.168.0.0/255.255.255.0(fsid=0,rw,async,inse- cure,no_root_squash)	24 25					
	c)		e IP address(es) is (are) the client's IPoIB address for an InfiniBand A or the client's iWARP address(es) for an RNIC.	26 27					
	doe	es no	The "insecure" option must be used because the NFS/RDMA client of use a reserved port. This does not interfere with normal NFS over operations.	28 29 30					
	d)	The	e remainder of this section will assume an export of /server	31					
	e)	Sta	rt the NFS server	32					
		i)	If the NFS/RDMA server was built as a module (CONFIG_SUNRPC_XPRT_RDMA=m in kernel config), load the RDMA transport module:	33 34 35					
			1. \$ modprobe svcrdma	36					
		ii)	Regardless of how the server was built (module or built-in), start the server:	37 38					
			1. \$ /etc/init.d/nfs start or service nfs start	39					
		iii)	Instruct the server to listen on the RDMA transport:	40					
			1. \$ echo rdma 20049 > /proc/fs/nfsd/portlist	41					
7)	Ch	eck	NFS Setup	42

13.3 TI RELIABLE DATAGRAM SE	ER\	VICE (RDS) USING OFED	1
13.3.1 RDS-PING PROCEDURE			2
١	Not	e: RDS does not support iWARP	3 4
1	1)	Use the command <i>modprobe rds_rdma</i> to add RDS support to the kernel	5
2	2)	Verify that the kernel supports RDS by issuing the <i>rds-info</i> command.	6
		a) The rds-info utility presents various sources of information that the RDS kernel module maintains. When run without any optional arguments rds-info will output all the information it knows of.	7 8 9
		Note : Package rds-tools 1.4.1-OFED-1.4.2-1 is required to run rds-info on Ubuntu. Also the rdstcp module needs to be loaded - 'modprobe rds-tcp'	10 11
3	3)	[For IB] Start one of the Subnet Managers in the cluster	12
		Note : RDS is IP based so you need to provide a host address either through an out of band Ethernet connection or through IPoIB. RDS also requires the LIDs to be set in an InfiniBand Fabric and therefore an SM must be run.	13 14 15
		Note: All SMs in the fabric should be tested.	16
4		Choose a host and use <i>rds-ping host</i> to communicate with every other end point in the fabric.	17 18
		Note : Be sure that you identify the correct host when using the command <i>rds- ping host</i> .	19 20
		 a) rds-ping is used to test whether a remote node is reachable over RDS. Its interface is designed to operate in a similar way to the standard ping(8) utility, even though the way it works is pretty different. 	21 22
		b) rds-ping opens several RDS sockets and sends packets to port 0 on the indicated host. This is a special port number to which no socket is bound; instead, the kernel processes incoming packets and responds to them.	23 24 25 26
5	5)	Verify that all nodes respond without error.	27
		Note: To avoid losing packets, do not run this while RDS-Stress is running.	28
13.3.2 RDS-STRESS PROCEDURE			29
1		Choose a host and start a passive receiving session for the RDS Stress test.	30 31
		It only needs to be told what port to listen on.	32
-		a) \$ rds-stress -p 4000 Chose a second host and start an active sending instance giving it the ad-	33
2		dress and port at which it will find a listening passive receiver. In addition, it is given configuration options which both instances will use.	34 35
		a) \$ rds-stress -T 5 -s recvhost -p 4000 -t 1 -d 1	36
		Note: If you repeat the test in less than one minute you may get the error	37
		message "Cannot assign requested address" since the port numbers are not immediately reusable. Either wait or change the port number using	38 39
		the -p option	40
			41
			42

Note: The -t option is for the number of tasks (child processes), which de-1faults to 1 so "-t 1" is optional. The -d option is for the message queue2depth, which also defaults to 1 so "-d 1" is optional.3

- Every second, the parent process will display statistics of the ongoing stress test. If the -T option is given, the test will terminate after the specified time and a summary is printed.
- 4) Verify that the test completes without error.
- 5) Repeat steps 1-4 until all end points in the cluster have been tested.

13.4 TI UDAPLTEST COMMAN	IDS USING OFED	1
	Server Command: dapItest -T S -D <ia_name></ia_name>	2
13.4.1 SETUP		3
13.4.1 SETUP	• The /etc/dat.conf needs to be verified to be sure that the correct interface is	4 5
	used. By default the dapl interface for IB is ib0 and for iWARP is eth2. If these are not correct for the current cluster then errors will occur.	6 7
	• It is also important to verify that the desired dapl library is being used.	8
	[For IB] an SM needs to be running.	9
	 [For iWARP hosts with Chelsio RNICs] Ensure that /sys/module/iw_cxgb3/parameters/peer2peer contains '1' on all hosts. 	10 11

	c	;) [For iWARP] - Not applicable - see 12.6.10	3
	3) (On the client device issue the following command on command line:	4
	e	a) [For IB & RoCE] ib_ send _bw -d <dev_name> -i <port>-s 1000000 -n 300 -m 2048</port></dev_name>	6
	t	(For Emulex RCA] ib_ send _bw -d <dev_name> -i <port>-s 1000000 - n 300 -m 2048 -t 126</port></dev_name>	7
	c	;) [For iWARP] - Not applicable - see 12.6.10	G
2		/erify that the operation completed without error and the level of perfor- nance achieved is reasonable and as expected.	1 1
13.5.14 Additional IB Notes			1
	1) A	Alternate read commands available	1
	a	a) Server command: ib_read_bw -m 2048	-
	t	 Client command (small): ib_read_bw -s 1 -n 25000 IPoIB Address for server -m 2048 	
	C	c) Client command (large): ib_read_bw -s 1000000 -n 300 <i>IPoIB Address</i> for server -m 2048	
2	2) A	Alternate write commands available	
	a	a) Server command: ib_write_bw -m 2048	
	t	 Client command (small): ib_write_bw -s 1 -n 25000 IPoIB Address for server 	
	C	c) Client command (large): ib_write_bw -s 1000000 -n 300 <i>IPoIB Address</i> for server -m 2048	
:	3) A	Alternate send commands available	
	a	a) Server command: ib_send_bw -m 2048	
	t	 Client command: ib_send_bw -s 1 -n 25000 IPoIB Address for server -m 2048 	
	C	c) Client command (large): ib_send_bw -s 1000000 -n 300 <i>IPoIB Address</i> for server -m 2048	
4	4) E	Explanation of parameters	
	a	 a) "-d" allows you to specify the device name which may be obtained from the command lane: <i>ibv_devinfo</i> 	
	t	o) "-i" allows you to specify the port number. This may be useful if you are running the tests consecutively because a port number is not immedi- ately released and this will allow you to specify another port number to run the test.	
	c	;) "-s" - this is the size of the operation you wish to complete	
	с	 "-n" - this it the number of operations you wish to complete. 	
	e	e) "-m" - this specifies the IB PMTU size. AS of 10/3/2011 some devices did not support greater than 2048	

13.5.15 Additional iWARP Notes	1
1) The "-c" option specifies to use the rdma_cm for connection	2

13.8 TI MPI - OPEN MPI USING	OF	ED		1
	The	e followii	ng values are used in examples below:	2
	•		OME: The absolute directory location of the Open MPI installation common to all systems under test.	3 4 5
	•	\$NP: T	he number of MPI processes to use in the test.	5 6
	•	\$HOST	FILE: The absolute filename location of the hostfile	7
	•		OME: The absolute directory location of the Intel MPI Benchmark bols installation that is common to all systems under test.	8
13.8.1 CLUSTER SETUP				10
	1)	Networ	k configuration requirements	11
		a) All	systems must be reachable by each other over IPoIB.	12
			nodes must agree on the IPoIB IP addresses of all systems (e.g., via c/hosts, DNS, or some other mechanism).	13 14
	2)		ne version of OFED must be installed in the same filesystem location ystems under test.	15 16
	3)		me version of the Intel MPI Benchmark (IMB) tools must be installed ame filesystem location on all systems under test.	17 18
			B can be used from the OFED installation or, if a later version of Open I is to be used, IMB can be downloaded from Intel's web site:	19 20
			<u>://software.intel.com/en-us/articles/intel-mpi-bench-</u> rks/?wapkw=intel%20mpi%20benchmarks	21 22
	4)		me version of Open MPI must be available in the same filesystem lo- on all systems under test.	23 24
		is r	en MPI can be used from the OFED installation, or, if a later version equired, can be downloaded and installed from the main Open MPI b site:	25 26
		<u>htt</u>	<u>://www.open-mpi.org/</u>	27
		i)	If building Open MPI from source, and if the OpenFabrics libraries	28 29
			and headers are installed in a non-default location, be sure to use thewith-openib= <dir> option to configure to specify the OpenFab-</dir>	30
			rics filesystem location.	31
		ii)	Open MPI can be installed once on a shared network filesystem that	32
			is available on all nodes, or can be individually installed on all sys- tems. The main requirement is that Open MPI's filesystem location	33 34
		:::)	is the same on all systems under test. If Open MPI is built from source, theprefix value given to configure	35
		iii)	should be the filesystem location that is common on all systems un-	36
			der test. For example, if installing to a network filesystem on the file-	37
			system server, be sure to specify the filesystem location under the common mount point, not the "native" disk location that is only valid	38
			on the file server.	39
				40

		 b) Open the make_ict file and change line 3 from CC = mpiicc to CC = mpicc 	:
		c) While still in the 'src' directory, invoke "make all"	
		d) Copy IMB-MPI1 which has just been built to the directory "/usr/local.	/bin"
3 8 3 CONFIGURING AND BUILDIN	G 0	PEN MPI 1.6.x FOR POWERLINUX SYSTEMS	
	The	ese are the instructions for configuring and building Open MPI 1.6.x on a wer Linux system.	
	1)	cmdline	
	,	 ./configureprefix=/usr/local/openmpi-1.6.4with-platform=/con- 	
		trib/platform/ibm/optimized-ppc64-gcc && make -j 16 && make insta	all
		The setting of the prefix will depend on where you usually do the insta	
		With RHEL6.x we typically use the module command from the envir ment-modules rpm to dynamically adjust the environment to pick up	
		specific MPI build. But, mpi-selector will work as well. Also, the valu	
		given to -j on the make is dependent on the number of available cor	
		For example on the P7 system at UNH-IOL, 16 should work fine.	
	2)	The main specifications are in the associated platform file. The one item	
		import for IB/RoCE testing is the line: <i>with_openib=/usr</i> This will ensur that the IB transport is supported. It also assumes that the RDMA stack i	
		stalled in the standard place. If not, then this parameter will have to be a	
		justed accordingly.	
		enable_mem_debug=no	
		enable_mem_profile=no	
		enable_debug=no	
		 enable_contrib_no_build=libnbc,vt 	
		enable_ft_thread=no	
		 with_openib=/usr 	
		enable_shared=yes	
		enable_static=no	
		CXXFLAGS=-m64	
		CCASFLAGS=-m64	
		FCFLAGS=-m64	
		• FFLAGS=-m64	
		CFLAGS=-m64	
		 with_wrapper_cflags=-m64 	
		 with_wrapper_cxxflags=-m64 	

OFA Interoperability Working Group OFA-IWG INTEROPERABILITY TEST PLAN		TI MPI - Open MPI using OFED September 24, 2013 RELEASE 1.49 DRAFT	
		 with_wrapper_fflags=-m64 	
		 with_wrapper_fcflags=-m64 	4
	3)	MPI Executable	
		 mpirunbind-to-core -np 16host <sys1>,<sys2> ./IMB-MPI1</sys2></sys1> 	4
		 The MPI executables should find the RDMA adapters and then figure out the appropriate connection method. Thebind-to-core can improve performance, but is certainly optional. 	
13.8.4 Test Setup			1
	1)	Create a hostfile (\$HOSTFILE) listing the hostname of each system that will be used in the test. If a system under test can run more than one MPI pro- cess (such as multiprocessor or multicore systems), list the hostname as many times as MPI processes are desired. For example, for two systems named node1.example.com and node2.example.com that are each able to run 4 processes:	
		shell\$ cat hostfile.txt	
		node1.example.com	
		node2.example.com	
	2)	Determine the number of Open MPI processes (\$NP) that are to be run de- termined by the number of host entries in the created hostfile.	
	3)	Open MPI defaults to probing all available networks at run-time to determine which to use. The mpirun parameter,mca btl openib,self, will force all traffic over the RDMA fabric for iWARP, InfiniBand, and RoCE. Also, it means that processes on the same system will use the OFA stack for com- munication rather than shared memory. This is also how you do "loopback" to force the use of an RDMA adapter on a single system. For OpenFabrics testing for iWarp, InfiniBand and RoCE, add this extra command line pa- rameter.	
		mca btl openib,self	
	4)	It has been discovered that the following Open MPI command line pa- rameter is required to facilitate multi RDMA adaptor vendor MPI rings; both iWarp and InfiniBand:	
		mca pml ob1mca btl_openib_flags 306	
	5)	It has been discovered that the following Open MPI command line pa- rameter is required to facilitate multi RNIC adaptor vendors MPI rings; iWarp specific:)

	m	ica bil_openib_receive_queues P,65536,256,192,128	1
13.8.5 TEST PROCEDURE			2
1)	Cre	eate a hostfile listing the MPI ring nodes, process distribution, and total	3
		nber of processes to use as indicated in steps 1 and 2 of section 12.11.2.	4
-		e filesystem location of this hostfile is irrelevant.	5
2)		cate the "mpirun" binary that will be used. This determines the version of en MPI that will be used.	6 7
3)	ver	cate the "IMB-MPI1" IMB binary. This must have been built against the sion of Open MPI selected above. If using an OFED distribution this build cess has already been performed.	8 9 10
4)	Vei	ify that a subnet manager has configured the fabric. If not, start one.	11
5)	Vei	ify that all hosts present within the hostfile are online and accessible.	12
6)	Ru	n the IMB-MPI1 benchmarks	13
7)		peat steps 4-6 using a different subnet manager until all subnet man- ers under test have been used.	14 15
8)		IMB benchmarks must pass successfully using all subnet managers der test in order for the devices under test defined within the hostfile pass.	16 17
13.8.6 METHOD OF IMPLEMENTATION FOR ALL LINUX OS'S			18
1)		perform step 4 of section 12.9.3 use "ibdiagnet -r" from a host defined in mpi hostfile and look for an "SM - Master" entry in the output	19 20
2)		perform step 5 of section 12.9.3 ping the IPoIB address of all hosts de- ed in the mpi hostfile from a host defined in said hostfile.	21 22
3)	tha	perform step 6 of section 12.9.3 use the following command from a host t can access all hosts defined within the hostfile; this host can be part of hostfile	23 24
	a)	For InfiniBand :	25 26
		\$MPIHOME/bin/mpirunmca btl openib,self,smmca pml ob1 -mca btl_openib_flags \ 306 -np \$NP -hostfile \$HOSTFILE \$IMBHOME/IMB- MPI1	27 28
	b)	For iWarp :	29 30
		\$MPIHOME/bin/mpirunmca btl openib,self,smmca pml ob1mca \ btl_openib_flags 306mca btl_openib_receive_queues	31
		P,65536,256,192,128 -np \ \$NP -hostfile \$HOSTFILE \$IMBHOME/IMB- MPI1	32 33
	C)	For RoCE :	34
		\$MPIHOME/bin/mpirunmca btl openib,self,smmca pml ob1mca btl_openib_flags 306mca btl_openib_receive_queues P,65536,120,64,32mca btl_openib_cpc_include rdmacm -np \$NP - hostfile \$HOSTFILE \$IMBHOME/IMB-MPI1	35 36 37
	d)	For PowerLinux Systems:	38
	u)	-	39
		mpirunmca btl openib,selfbind-to-core -np 16host <sys1>,<sys2> ./IMB-MPI1</sys2></sys1>	40 41
			41

13.9 TI MPI - OHIO STATE UNIVER 13.9.1 MVAPICH - SETUP	SITY USING OFED	1 2
1)	Network configuration requirements	3
	 All systems must be reachable by each other a common network that supports TCP (Ethernet, IPoIB, etc.) 	4 5
	 All nodes must agree on the IP addresses for all TCP networks on all systems (e.g., via /etc/hosts, DNS, or some other mechanism). 	6 7
2)	The same version of OFED must be installed in the same filesystem location on all systems under test.	8 9
3)	MVAPICH is included in OFED distributions. The updated versions of MVAPICH can be obtained from OpenFabrics website.	10 11
4)	The same version of MVAPICH must be available in the same filesystem lo- cation on all systems under test.	12 13
	 a) MVAPICH can be installed once on a shared network filesystem that is available on all nodes, or can be individually installed on all systems. The main requirement is that MVAPICH filesystem location is the same on all systems under test. 	14 15 16 17
5)	All systems must be setup with at least one identical user account. This user must be able to SSH or RSH to all systems under test from the system that will launch the MVAPICH tests with no additional output to stdout or stderr (e.g., all SSH host keys should already be cached, no password/passphrase prompts should be emitted, etc.).	18 19 20 21
6)	The lockable memory limits on each machine should be set to allow un- limited locked memory per process. This can be achieved by using ulimit command.	22 23 24
7)	The underlying IB network(s) used in the test should be stable and reliable. No other fabric interoperability tests should be running during the MVAPICH tests.	25 26
8)	Multiple versions of MVAPICH can peacefully co-exist on a system as long as they are installed into separate filesystem locations (i.e., configured with a differentprefix argument). All tests must be built and run with a single in- stallation of MVAPICH.	27 28 29 30
9)	MVAPICH tests should be run across at least 5 separate systems to force the use of the IB networks (vs. using just shared memory for in-system communication).	31 32 33
	Note : MVAPICH is commonly referred to as MVAPICH1 to distinguish it from the new and updated MVAPICH2	34 35
13.9.2 MVAPICH - TEST SETUP AND	PROCEDURE	36
1)	Test Setup	37
	a) Create a hostfile listing the hostname of each system that will be used in the test. If a system under test can run more than one MPI process (such as multiprocessor or multicore systems) list the hostname as many times as MPI processes are desired. For example, for two 2 pro- cessor systems named host1 and host2	38 39 40 41

	\$ c hos hos hos hos	t1 t2	1 2 3 4					
b)	Download and install Intel® MPI Benchmarks on all nodes from:							
,		p://www.intel.com/cd/software/products/asmo-	6					
		eng/cluster/mpi/219848.htm	7					
	Fol	low the instructions below to install:	8					
	i)	untar downloaded archive	9					
	ii)	open <natured directory="">/src/make_mpich and fill in the following variables:</natured>	10 11					
		 MPI_HOME=<path directory="" mvapich1="" to=""> #mine was /usr/mpi/gcc/mvapich-1.0.1</path> 	12 13					
		CPPFLAGS= -DCHECK	14					
	iii)	gmake -f make_mpich	15					
	Thi	s will install the benchmarks inside the MPI_HOME/tests directory	16					
	No fau	te: Intel® MPI Benchmarks are installed with OFED installation by de- \ensuremath{I} t	17 18					
c)	Ent	er all nodes and run the following commands:	19					
	i)	echo "PATH=\\$PATH: <path directory="" mvapich1="" to="">/bin:<path to<br="">mvapich1 directory>/tests/IMB-3.0" >> /<username>/.bashrc # or .cshrc</username></path></path>	20 21 22					
	ii)	echo "ulimit -l unlimited" >> / <username>/.bashrc # or .cshrc</username>	23					
	iii)	source / <username>/.bashrc # or .cshrc</username>	24					
		te: these commands may fail or produce unexpected results with a red \$HOME	25 26					
Tes	sting	Procedure	27					
a)	The	e following values are used in the examples below	28					
	i)	\$MPIHOME - The absolute directory location of the MVAPICH in- stallation that is common to all systems under test	29 30					
	ii)	\$NP - The number of MPI processes that are to be run determined by the number of host entries in the created hostfile.	31 32					
	iii)	\$HOSTFILE - The absolute location of the hostfile	33					
b)	Ru	n Intel® MPI Benchmarks:	34					
	i)	Run the PingPong and PingPing point-to-point tests	35					
		\$MPIHOME/bin/mpirun_rsh -ssh -np \$NP IMB-MPI1 -multi 0 Ping- Pong PingPing -hostfile \$HOSTFILE	36 37					
	ii)	Run all the tests (PingPong, PingPing, Sendrecv, Exchange, Bcast, Allgather, Allgatherv, Alltoall, Reduce, Reduce_scatter, Allreduce, Barrier), in non-multi mode.	38 39 40					
		\$MPIHOME/bin/mpirun_rsh -ssh -np \$NP IMB-MPI1 -multi 0 -hostfile \$HOSTFILE	41 42					

2)

13.9.3 MVAPICH2 - SETUP			1
	1)	Download and install OFED on all nodes from:	2
		http://www.openfabrics.org/downloads/OFED	3
	2)	Download and install Intel® MPI Benchmarks on all nodes from:	4
		http://www.intel.com/cd/software/products/asmo-	5
		na/eng/cluster/mpi/219848.htm	6
		You will have to accept a license. Follow the instructions below to install.	7 8
		a) untar downloaded archive	9
		b) one suptomed directory (are males period and fill in the following your	10
		 MPI_HOME=<path directory="" mvapich2="" to=""> #mine was /usr/mpi/gcc/mvapich2-1.0.3</path> 	11 12
		ii) CPPFLAGS= -DCHECK	13
		c) gmake -f make_mpich	14
		This will install the benchmarks inside the MPI_HOME/tests directory	15 16
	3)	All nodes should be physically connected.	17
	4)	Enter all nodes and run the following cmds:	18
		a) echo "PATH=\\$PATH: <path directory="" mvapich2="" to="">/bin:<path directory="" mvapich2="" to="">/tests/IMB-3.0" >> /<username>/.bashrc # or .cshrc</username></path></path>	19 20
		b) echo "ulimit -l unlimited" >> / <username>/.bashrc;</username>	21
		c) source / <username>/.bashrc # or .cshrc</username>	22
	5)	Create an mpi ring:	23
	-,	a) Construct a file called hosts that has the following format. Include as	24
		many lines as you have hosts. Be sure to leave a blank line at the end of	25 26
		i) <host>ifhn=<infiniband address="" ip=""></infiniband></host>	27
		b) Run the following commands	28
		i) mpdboot -n `cat hosts wc -l` -f hostsifhn= <localhost infiniband="" ip<="" th=""><th>29</th></localhost>	29
		address>	30
		i) inputace - π OF HONAL, shows current hing members.	31
	6)	MVAFICH lesis should be full across at least 5 separate systems to force	32 33
			34
13.9.4 MVAPICH2 - TEST PROCE	פווס		35
Step A:		r IB] Run a subnet manager from one node only.	36
	[37
Step B	Ru	n Intel® MPI Benchmarks:	38
	1)	Two sets of tests should be run, with these command lines	39
	,	[For IB]	40
			41
			42

a)	mpirun_rsh -ssh -np <number node="" nodes="" number="" of="" processors="" x=""></number>	
	IMB-MPI1 -multi 0 PingPong PingPing	-

 b) mpirun_rsh -ssh -np <number of nodes X number of processors/node> IMB-MPI1

[For iWARP]

- a) mpirun_rsh -ssh -np <number of nodes X number of processors/node> MV2_USE_IWARP_MODE=1 MV2_USE_RDMA_CM=1 IMB-MPI1 multi 0 PingPong PingPing
- b) mpirun_rsh -ssh -np <number of nodes X number of processors/node> MV2_USE_IWARP_MODE=1 MV2_USE_RDMA_CM=1 IMB-MPI1

The first command runs just the PingPong and PingPing point-to-point tests, but makes all tasks active (pairwise).

The second command runs all the tests (PingPong, PingPing, Sendrecv, Exchange, Bcast, Allgather, Allgatherv, Alltoall, Reduce, Reduce_scatter, Allreduce, Barrier), in non-multi mode.

- 2) [For IB] If the test passes shutdown current subnet manager and start another one on a different node; run both tests again.
- 3) [For IB] Repeat until all nodes have run a subnet manager and passed all tests.

14 INFINIBAND SPECIFIC IN		PROCEDURES USING WINOF	1
14.1 IB LINK INITIALIZE US	ING W IN	OF	2
14.1.1 Setup			3 4
		te: The WinOF Subnet Manager and diagnostics are still evolving as com- ed to OFED. Therefore, you must include an OFED Linux node along with the	5 6 7
	1)	Disconnect the full topology and select a cable whose length should be a maximum of 15 meters for SDR and 10 meters for DDR when using copper cables.OF node to run diagnostics for this test.	8 9 10 11
	2)	Verify that no SM is running	12
	3)	Connect two devices back to back	13
	4)	ssh to the OFED node.	14
		a) Run "ibdiagnet -lw 4x" to verify portwidth	15 16
		b) Run "ibdiagnet -Is 2.5" to check link speed. Interpret output and com- pare to advertised speed.	17 18
		Note : This command will only produce output if the link speed is anything other than SDR. Keep this in mind during your interpretation of the output.	19 20
	5)	Repeat steps 1-3 with a different device pairing.	21
		a) All device pairs must be tested except SRP target to SRP target.	22
		i) HCA to HCA	23 24
		ii) HCA to Switch	25
		iii) HCA to Target	26
		iv) Switch to Switch	27
			28 29
		v) Switch to Target	30
		Note : HCA to Target and HCA to HCA cannot be tested under WinOF 2.0.2 because there are no utilities available. Switches can be tested by using a Linux Host and the OFED Utilities.	31 32
		b) Each device must link to all other devices in order for the device to pass link init over all.	33 34 35
14.1.2 Recommendations			36
	cor	order to determine Switch to Target and Switch to Switch link parameters, run nmands from an HCA linked to the switch under test. This does require more erpretation of the output to differentiate the reported parameters.	37 38 39 40 41 42 28

14.2 IB FABRIC INITIALIZATION	USI		1
14.2.1 Architect the Network w	e wa	ant to build.	2
	pare	e: The WinOF Subnet Manager and diagnostics are still evolving as com- ed to OFED. Therefore, you must include an OFED Linux node along with the OF node to run diagnostics for this test.	3 4 5
	2)	Design and implement a Cluster Topology. End to end IPoIB connectivity is required between all end points. Therefore you must create and assign IP addresses to each IB end point. See <u>Figure 5- Sample Network Configuration</u> below.	6 7 8 9 10
14.2.2 Procedure			11
	2) 3)	Connect the HCAs and switches as per the Architected Network and make sure that no SM/SA is running on the Fabric. Start an SM on a device and let it initialize (all SMs will need to be tested) Visually verify that all devices are in the active state using LEDs (however the vendor decided to implement it). The following step s must be done using a Linux OFED end point. a) Run "ibdiagnet -pc" to clear all port counters b) Wait 17 seconds as per the specifications requirements.	12 13 14 15 16 17
		c) Run "ibdiagnet -c 1000" to send 1000 node descriptions.	18 19
		 d) Run "ibdiagnet" to generate fabric report and open report to see results. /tmp/ibdiagnet.sm e) Run "ibchecknet" to build guid list. 	20 21 22
14.2.3 Verification Procedures			23 24
	2) 3) Res SM	Review "PM Counters" section of the fabric report. There should be no il- legal PM counters. The Specification says there should be no errors in 17 seconds. Review "Subnet Manager " section of the fabric report. Verify that the running SM is the one you started and verify number of nodes and switches in the fabric. Review the ibchecknet report and verify that there are no duplicate GUIDs in the fabric Note : the reports are located in the /tmp directory tart all devices in the fabric and follow Sections 13.2.2 and 13.2.3. Run the from a different device in the fabric until all SMs present have been used. All	25 26 27 28 29 30 31 32 33 34
	Eac	s on managed switches and one instance of opensm must be used. h device must pass all verification procedures with every SM to pass Fabric alization test.	35 36 37 38 39 40 41

Table 29 - ibdi	agnet commands
Commands	Description
Ibdiagnet -c 1000	send 1000 Node Descriptions
ibdiagnet -h	Help
Ibdiagnet -lw 4x - ls 2.5	Specify link width and speed
Ibdiagnet - pc	Clear Counter
ibdiagnet -t <file></file>	Compare current topology to saved topology
ibdiagnet -wt	Writes the topology to a file

Note: The topology file is being generated after the SM starts but before any testing has started. The topology comparison is being performed after testing has been completed but before the systems get rebooted. A topology check is performed during every part of every test section that does not specifically state "change the topology". For example Fabric Init only has 1 part so there is only 1 check but RDS has 2 parts so 2 checks are performed. However, IPoIB has 3 parts for each of 2 modes but 1 of those parts specifically says to change the topology so only 4 checks occur.

14.3 IB IPOIB DATAGRAM MODE 14.3.1 SETUP	(DN	I) USING WINOF	1 2
Ν		WinOF 2.0.2 only supports IPoIB Datagram Mode. Future WinOF releases pport IPoIB Connected-Mode.	3 4
		ect the HCAs and switches as per the Architected Network and make sure SM is running on the Fabric.	5 6 7
Ar or wa	n SM i the ould	rocedure, as the previous ones, will be based on the cluster connectivity. I/SA which supports IPoIB (sufficient IB multicast support) will be running HCAs, or on a switch with an embedded SM/SA or a third HCA which only run SM/SA for the partner pair (with a switch in the middle). This pro- e has been developed for the Windows environment.	8 9 10 11 12
pr	iate l	nal : In the procedures below, an IB analyzer can be inserted in the appro- link to obtain traces and validate the aspects of the procedures specifically ad below in subsequent sections.	13 14 15
14.3.2 IPOIB INTERFACE CREATION	AND	IPOIB SUBNET CREATION	16
1)	Сс	onfigure IPoIB address. All addresses must reside on the same subnet.	17 18
2)	Ve	rify which 'Local Area Connection' the IPoIB interfaces are bound to:	19
	a)	Start Server Manager View Network Connections.	20
	b)	Find the OpenFabrics IPoIB interfaces (one per HCA port). If your plat- form has two Ethernet ports, then IPoIB interfaces likely will be assigned 'Local Area Connection 3' & 'Local Area Connection 4' as the Ether- net ports are assigned 'Local Area Connection' and 'Local Area Con- nection 2' .	21 22 23 24
3)		et interfaces to 10.0.0.x/24 (10.0.0.x/netmask 255.255.255.0) using the fol- wing commands:	25 26
	a)	netsh interface ip set address "Local Area Connection 3" static 10.10.4.x 255.255.255.0	27 28
	b)	netsh interface ip set address "Local Area Connection 4" static 10.10.4.y 255.255.255.0	29 30
4)	Vie	ew the IPoIB IP address using the following command	31
	a)	netsh interface ip show address "Local Area Connection 3"	32
14.3.3 PING PROCEDURES			33
Step A 1)	Sto	op all SM's and verify that none are running	34
2)		ower cycle all switches in the fabric (this insures that the new SM will con- ure all the links and create the multi-cast join).	35 36
3)	Sta	art an SM (All SM's will need to be tested) and let it initialize	37
	the	ote : For link testing it is recommended to use an OFED Linux OpenSM as e Windows version of OpenSM does not support all SA queries and func- nality of the OFED 1.4 OpenSM.	38 39 40 41

		vic	te : All WinOF installed systems contain a disabled OpenSM windows ser- e. A WinOF installation option/feature is to automatically 'start/enable' the enSM service on the local node.	1 2 3
		•	Start Server Manager Configuration Services InfiniBand Subnet Manager Automatic apply	4
		•	Start Apply will enable the local OpenSM to start and be started upon system boot.	5 6
		a)	Visually verify that all devices are in the active state. Orange led will be on if the port is active.	7 8
		b)	From a Linux system, Run "ibdiagnet" and verify that the SM you started is the one that is running and and that it is the master. You will need to know the GUID of the device since the SM will be reassigned on each reboot; the Windows 'vstat' command displays HCA info.	9 10 11 12
		c)	Verify that all nodes and switches were discovered.	13
		d)	WinOF 2.0.2 does not provide a ibdiagnet utility.	14
			Note : Ibdiagnet may show more switches than indicated by the physical number of switch platforms present. This is because some switches have multiple switch chips.	15
	4)	Fx	amine the arp table (via arp -a) and remove the destination node's ib0 ad-	17 18
	•)		ess from the sending node's arp table (via arp -d).	19
	5)	lss	ue the command: sysctl net.ipv4.neigh.ib0.unres_qlen=18	20
		a)	This sets the qlen variable to 18 which increases the buffer size so that you do not get an initial dropped packet when using ping sizes 8192 and greater.	21 22 23
	6)		ig every IPoIB interface IPv4 address except localhost with packet sizes 511, 1025, 2044, 8192, 32768 and 65500. 'ping /?' displays ping help.	24
		a)	10 packets of each size will be sent	25 26
		b)	Every packet size is a new ping command.	27
			Note: Windows does not support 65507 so we used 65500.	28
			Note : This is done from the Head Node utility "Run a Command" using the following command:	29 30
			for %i in (64, 511, 2044, 8192, 32768 and 65500) DO %d arp -d %d & ping -i 1 -n 10 -l %i %d & arp -d %d	31 32
	7)	los	order to pass Step A, a reply must be received for every ping sent (without ing a single packet) while using each one of the SMs available in the ster.	33 34 35
Step B	1)	Bri	ng up all HCAs but one.	36
	2)		irt an SM (all SMs will need to be tested).	37 38
	2) 3)		eck for ping response between all node (All to All).	39
	0)		A response from the disconnected HCA should not be returned.	4(
	4)		sconnect one more HCA from the cluster.	41

Last Modified: 9/24/13 11:04 am

 6) Connect the first machine (the one that was not connected) and check for ping response from all nodes that are still connected. 7) Connect the disconnected HCA to a different switch on the subnet which will change the topology. 8) Ping again from all nodes (this time we should get a response). 9) Follow Step B, this time bring the interface down and then back up: Start Server Manager View Network Connections IPolB(Local Area connection) disable and enable commands instead of physically disconnecting the HCAs. Note: Each step must exhibit the expected behavior while using each SM in order for the device to pass Step B overall. Step C 1) Follow Step A and B using a different SM until all SM's have been used. Only one instance of each available SM is required. Steps A, B, and C must pass in order for the device to pass 13.3.3 overall. 2) Issue the command: syscil net.ipv4.neigh.ib0.unres_qlen=3 a) This sets the qlen variable back to the default. 14.3.4 FTP PROCEDURE FTP procedures requires an FTP server to be configured on each machine in the partner pair. An FTP client needs to be available On each machine as well; an FTP server is a component of the IIS 'Internet Information Services' manger which not a part of a standard Windows installation: See Start Server Manager Roles Add IIS. Configure FTP server via IIS manager. 14.3.4.1 SETUP 1) Make sure ftpd is installed on each node for the FTP application. 2) A special account for this should be created as follows: b) Username: Interop c) Password: openfabrics 14.3.4.2 Proceduree Run FTP server on all nodes. 1) Start an SM (all SMs will need to be tested) and let it initialize (ref MS Network Willi is docs) a) Verify that the running SM is the one you started. c) FTP: 	OFA Interoperability Working Group OFA-IWG INTEROPERABILITY TEST PLAN		IB IPoIB Datagram Mode (DM) using WinOF September 24, 2013 RELEASE 1.49 DRAFT

14.4 IB SM FAILOVER AND HANDO	OVER PROCEDURE USING WINOF	1
14.4.1 SETUP		2
1)	Connect HCAs per the selected topology.	3
2)	In this test, all active SMs on the fabric which are going to be tested, must	4
_,	be from the same vendor. They will be tested pairwise: two at a time.	5
14.4.2 PROCEDURE		6
1)	Disable all SMs in the cluster.	7
2)	Start a SM on either machine in a chosen pair.	8 9
	 a) Start Server Manager Configuration Services InfiniBand Subnet Manager start apply 	10 11
3)	Run "vstat" on all Windows nodes in the fabric.	12
	a) Verify HCA link active in vstat output.	13
4)	Verify IPoIB is active on each node	14
,	a) Verify Local Area Connection assigned to IPoIB interface:	15
	i) Start Control Panel Network and Sharing Center Manage Net-	16
	work Connections.	17
	b) Show IPv4 address assigned to IPoIB Interface(s):	18
	i) netsh interface ip show address "Local Area Connection 3"	19
	ii) netsh interface ip show address "Local Area Connection 4"	20
	c) Verify the IPoIB devices (one per cabled connected HCA port) are visible & operational from a device driver perspective using Device Manag-	21 22
		23 24
	i) Start Run devmgmt.msc	24
	 Ping the IPoIB interface IPv4 address local and remote, verify traffic is actually going in/out over IPoIB 'local area connection x'. 	26
5)	Start an Open SM on the second machine in the current pair.	27
6)	Verify that the SMs behave according to the SM priority rules.	28
	a) The Windows OpenSM log file is located at '%windir%\temp\osm.log'.	29
	Note: The SM with highest numerical priority value is master and the	30 31
	other is in standby. If both SMs have the same priority value then the SM	32
	with the smallest guid is master and the other is in standby.	33
7)	Verify that all nodes in the cluster are present - ping all IPoIB interfaces	34
8)	Shutdown the master SM.	35
9)	Verify the other active SM goes into the master state: see osm.log file.	36
10)) Verify that all nodes in the cluster are present - ping all IPoIB interfaces	37
11)) Start the SM you just shutdown.	38
12)) Verify that the newly started SM resumes it's position as master while the other goes into standby again; see '%windir%\temp\osm.log'.	39 40
13)) Verify that all nodes in the cluster are present - ping all IPoIB interfaces	41
		42

 15) Verify that the previous master SM is still the master; view %windir%temp\osm.log. 16) Verify that all nodes in the cluster are present - ping all IPolB interfaces 17) Repeat proceeding steps [1-16] 2 more times with the same node pair, ensuring that the below criteria is met (total of 3 tests per pair which can be run in any order); a) First SM to be started having highest numerical priority value. b) Second SM to be started having highest numerical priority value. c) Both SMs having equal numerical priority values. 18) Repeat steps 1-17 until all possible SM pairs from identical vendors in the cluster have been tested. 	 5) Verify that the previous master SM is still the master; view "%windir%\temp\osm.log". 6) Verify that all nodes in the cluster are present - ping all IPoIB interfaces 7) Repeat proceeding steps [1-16] 2 more times with the same node pair, ensuring that the below criteria is met (total of 3 tests per pair which can be run in any order): a) First SM to be started having highest numerical priority value. b) Second SM to be started having highest numerical priority value. c) Both SMs having equal numerical priority values. 8) Repeat steps 1-17 until all possible SM pairs from identical vendors in the cluster have been tested. 	14) \$	Shutdown the standby SM.	1
 %windir%\temp\osm.log'. 16) Verify that all nodes in the cluster are present - ping all IPoIB interfaces 17) Repeat proceeding steps [1-16] 2 more times with the same node pair, ensuring that the below criteria is met (total of 3 tests per pair which can be run in any order): a) First SM to be started having highest numerical priority value. b) Second SM to be started having highest numerical priority value. c) Both SMs having equal numerical priority values. 18) Repeat steps 1-17 until all possible SM pairs from identical vendors in the cluster have been tested. 	 %windir%itemplosm.log'. 6) Verify that all nodes in the cluster are present - ping all IPoIB interfaces 7) Repeat proceeding steps [1-16] 2 more times with the same node pair, ensuing that the below criteria is met (total of 3 tests per pair which can be run in any order): First SM to be started having highest numerical priority value. Second SM to be started having highest numerical priority value. Both SMs having equal numerical priority values. 8) Repeat steps 1-17 until all possible SM pairs from identical vendors in the cluster have been tested. 		-

	shc	te: For the April 2012 Interop events, the OFILG decided that each target only advertise two volumes in order to reduce the amount of time required un the tests	19 20 21
14.5.2 WINDOWS PROCEDURE			22 23
	1)	Start an SM (all SM's will need to be tested) and let it initialize.	23 24
		a) Verify that the running SM is the one that you started	25
	2)	Choose a node to work with	26
	3)	Verify the SRP driver loaded correctly; locate the SRP Miniport.	27
		a) Start Control Panel Device Manager Storage Controllers [InfiniBand SRP Miniport]	28 29
	4)	Discover + Enable (bring online) the SRP drive(s)	30
		a) Start Server Manager Storage Disk Management	31
	5)	You will find a basic 'unknown' and 'offline' disk; this one of your SRP volume(s).	32 33
	6)	Right-click the offline disk and select 'online'.	34 35
	7)	Right-click the volume space, assign the drive letter 'T'.	36
	8)	Right-click the volume space, format the volume.	37
	9)	Access the SRP drive via assigned drive letter. From a Windows/DOS command prompt window, execute the following commands.	38 39
		a) vol T:	40
		b) dir T:\ (should be empty)	41

 n) dir Tkimp (should be empty) n) midir Tkimp o) dir Tkimp (should be empty) p) del WOF3.msi 10) For each SRP target located in Procedure #4 a) Perform step 9 for each volume found for all targets as determined by Windows Procedure step #4 - see <u>Discover + Enable (bring online) the SRP drive(s)</u> 11) Take SRP drive offline a) Start Server Manager Storage Disk Management b) Right-click the online disk and select 'offline' c) dir Tki (should fail). 12) Reboot all devices in the fabric and repeat the procedure using a different SM. Note: An HCA must successfully complete all operations to and from all volumes on all targets are all that is required. 	OFA Interoperability Working Group OFA-IWG INTEROPERABILITY TEST PLAN		IB SRP using WinOF September 24, 2013 RELEASE 1.49 DRAFT

	•	If the dt-svr command was executed on interface address is 10.10.4.200 then	a system where the IPoIB
	•	'dt-cli 10.10.4.200 interop' would run th tween the client and server.	e above dap2tests be-
	•	'dt-cli 10.10.4.200 conn' is a simple, qu client server connection is operationa	• •

14.7 IB MPI - INTEL MPI USING W	ΙΝΟ	F		1
14.7.1 Requirements				2
1)		el Mi m In	PI is not part of the WinOF installation; acquire Intel MPI installer file tel.	3 4
2)			ame O/S version (Windows Server 2008-HPC) on homogenous systems.	5 6
3)		PI tes currii	ting requires a reliable IB fabric without other fabric interop testing	7 8
4)	Pri	vate	Ethernet Network configuration	9
	a)	DN	S names must match hostnames in hosts file.	10
5)	Wi	nOF	Installation requirements	11
,	a)	Ins	tall the latest version of WinOF on all systems (double-click nOF_wlh_x64.msi); see	12 13
		i)	http://www.openfabrics.org/downloads/WinOF/README	14
		ii)	Select the 'default' set of install features; includes uDAPL.	15
		iii)	Run OpenSM either on the headnode OR from one of the IB switches.	16 17
		iv)	If OpenSM on the headnode, select WinOF install feature 'OpenSM Started'.	18 19
	b)		ce WinOF installation on all nodes has completed, configure IPoIB erfaces.	20 21
		i)	%windir%\system32\Drivers\etc\hosts should be setup with IB host- names and static IP addresses.	22 23
		ii)	Assign IPv4 address, from hosts file, to each IPoIB interface; Example: Local Area Connection 3 is the 1st IPoIB interface.	24 25
			netsh interface ip set address "Local Area Connection 4" static 10.10.4.y 255.255.255.0	26 27
			This allows you to set the IPoIB IP address.	28
			netsh interface ip show address "Local Area Connection 3"	29
			This allows you to view the IPoIB IP address.	30
		iii)	Verify by pinging IPoIB interface addresses on all nodes.	31
				32
14.7.2 Setup information for Intel MPI				33
		ntel	MPI on every cluster node:	34
				35
1)	Inte	el MI	<u>PI runtime environment kit</u>	36
	a)	http	://www.intel.com/cd/software/products/asmo-na/eng/308295.htm	37
2)	Inte	el MI	PI Benchmarks,	38 39
	a)		o://www.intel.com/cd/software/products/asmo-na/eng/clus- mpi/219848.htm	40
3)	Ad	d ide	entical user account (%SystemDrive%\users\test) on every node.	41 42

4) Headnode mount points (%SystemDrive%\test\export) on user accounts.

14.7.3	Additional	Information

1)	Go to the individual test directories and follow the steps in the respective README-*.txt files.

- 2) For Intel MPI Support Services go to:
 - a) <u>http://software.intel.com/en-us/articles/intel-mpi-library-for-win-dows/all/1/</u>
 - b) See Intel MPI Reference Manual for Additional information

14.7.4 Intel MPI (MVAPICH 2) - Test Procedure

SUP	rocedure	12
1)	Run a subnet manager from one node only.	13
2)	Run Intel® MPI Benchmarks from the HPC head-node:	14
	a) Two sets of tests should be run, with these command lines	15
	 mpiexec -np <number nodes="" number="" of="" proces-<br="" x="">sors/node> IMB-MPI1 -multi 0 PingPong PingPing</number> 	16 17
	 mpiexec -np <number nodes="" number="" of="" proces-<br="" x="">sors/node> IMB-MPI1</number> 	18 19
	The first command runs just the PingPong and PingPing point-to- point tests, but makes all tasks active (pairwise).	20 21
	The second command runs all the tests (PingPong, PingPing, Send- recv, Exchange, Bcast, Allgather, Allgatherv, Alltoall, Reduce, Reduce_scatter, Allreduce, Barrier), in non-multi mode.	22 23
	 b) If the test passes shutdown current subnet manager and start another one on a different node; run both tests again. 	24 25
3)	Repeat until all nodes have run a subnet manager and passed all tests.	26 27
		28

15 BUG REPORTING METHODOLOG	Y DURING PRE-TESTING	1
	e following bug reporting methodology will be followed during the execution of	
inte	eroperability pre-testing at UNH-IOL.	3
1)	UNH-IOL and the OEMs (e.g. Chelsio, Data Direct, Intel, NetApp, Mellanow will assign a focal point of contact to enable fast resolution of problems.	5
2)	Bug reports will include:	6 7
	a) Detailed fail report with all relevant detail (Test/Application, Topology.).	
	b) [For IB] IB trace if needed.	9
	c) [For iWARP] iWARP, TCP and SCTP traces if needed.	10
3)	Bug reports will be sent via email by UNH-IOL to the focal point assigned b	•
	the OEM	12
4)	Bug reports and suggested fixes will be sent to the OpenFabrics devel- opment community - <u>OFA Bugzilla</u> . When such reports are communicated,	13 • 14
	UNH-IOL will ensure that confidentiality between UNH-IOL and the OEM will	ill 15
	be maintained. Bug reports will be generalized and not include any compan specific proprietary information such as product name, software name,	y 16
	version etc.	17
5)	All bug fixes/issues that are found during testing will be uploaded to the	18
	OpenFabrics repository. Documentation related to fixes will not mention an company specific proprietary information.	
No		20
	Ite: This test plan does not cover how bugs will be reported by IBTA/CIWG of IF iWARP during or after interoperability testing at plugfests.

16 RESULTS SUMMARY

16.1 INFINIBAND SPECIFIC TEST RESULTS

Please add a check mark whenever a test case passes and when the system is behaving according to the criteria mentioned below. Otherwise indicate a failure along with a comment explaining the nature of the failure.

Results Table 1 - IB Link Initialize

Test #	Test	Pass	Fail	Comment	1
1	Phy link up all ports				1

Results Table 2 - IB Fabric Initialization

Test #	Test	Pass	Fail	Comment	1
1	Verify that all ports are in Armed or Active state				1

Results Table 3 - IB IPoIB - Connected Mode (CM)

Test #	Test	Pass	Fail	Comment
1	Ping all to all - Ping using SM 1			
2	Ping all to all - Ping using SM 2			
3	Ping all to all - Ping using SM 3			
4	Ping all to all - Ping using SM 4			
5	Ping all to all - Ping using SM 5			
6	Ping all to all - Ping using SM 6			
7	Ping all to all - Ping using SM x			
8	Connect/Disconnect Host			
9	FTP Procedure			

Test #	Test	Pass	Fail	Comment
1	Ping all to all - Ping using SM 1			
2	Ping all to all - Ping using SM 2			
3	Ping all to all - Ping using SM 3			
4	Ping all to all - Ping using SM 4			
5	Ping all to all - Ping using SM 5			
6	Ping all to all - Ping using SM 6			
7	Ping all to all - Ping using SM x			
8	Connect/Disconnect Host			
9	FTP Procedure			

Results Table 4 - IB IPoIB - Datagram Mode (DM)

Table 5 - IB SM Failover/Handover

Test #	Test	Pass	Fail	Comment	
1	Basic sweep test				
2	SM Priority test				
3	Failover test - Disable SM1				
4	Failover test - Disable SM2				

Results Table 6 - IB SRP

Test #	Test	Pass	Fail	Comment	
1	Basic dd application				
2	IB SM kill				

Test #	Test	Pass	Fail	Comment	
1	Basic Setup				
2	Configure Gateway				
3	Add Storage Device				
4	Basic dd application				
5	IB SM kill				
6	Disconnect Host/Target				
7	Load Host/Target				
8	dd after SRP Host and Target reloaded				
9	Reboot Gateway				
10	dd after FC Gateway reboot				

Results Table 8 - Ethernet Gateway - (IB Specific)

Test #	Test	Pass	Fail	Comment
1	Basic Setup			
2	Start ULP			
3	Discover Gateway			
4	SM Failover			
5	Ethernet gateway reboot			
6	ULP restart			
7	Unload/load ULP			

OFA Interoperability Working Group	Ethernet Specific Test Results	September 24, 2013
OFA-IWG INTEROPERABILITY TEST PLAN	RELEASE 1.49	DRAFT

16.2 ETHERNET SPECIFIC TEST RESULTS Results Table 9 - iWARP Link Initialize Test # Test Comment Pass Fail Phy link up all ports Verify basic IP connectivity Table 10 - RoCE Link Initialize Test # Test Pass Fail Comment Phy link up all ports Verify basic IP connectivity

16.3 TRANSPORT INDEPENDENT TEST RESULTS

Results Table 11 - TI iSER

Test #	Test	Pass	Fail	Comment
1	Basic dd application			
2	IB SM kill			
3	Disconnect Initiator			
4	Disconnect Target			
5	Repeat with previous SM Slave			

Results Table 12 - TI NFS Over RDMA

Test #	Test	Pass	Fail	Comment
1	File and directory creation			
2	File and directory removal			
3	Lookups across mount point			
4	Setattr, getattr, and lookup			
5	Read and write			
6	Readdir			
7	Link and rename			
8	Symlink and readlink			
9	Statfs			

Results Table 13 - TI RDS

Test #	Test	Pass	Fail	Comment	34
1	rds-ping procedure				35
2	rds-stress procedure				36

Results Table 14 - TI uDAPL

Test #	Test	Pass	Fail	Comment
1	P2P - Connection & simple send receive			
2	P2P - Verification, polling & scatter gather list			
3	Switched Topology -Verification and private data			
4	Switched Topology - Add multiple endpoints, polling, & scatter gather list			
5	Switched Topology - Add RDMA Write			
6	Switched Topology - Add RDMA Read			
7	Multiple Switches - Multiple threads, RDMA Read, & RDMA Write			
8	Multiple Switches - Pipeline test with RDMA Write & scatter gather list			
9	Multiple Switches - Pipeline with RDMA Read			
10	Multiple Switches - Multiple switches			

Results Table 15 - TI RDMA Basic Interop

Test #	Test	Pass	Fail	Comment
1	Small RDMA READ			
2	Large RDMA READ			
3	Small RDMA Write			
4	Large RDMA Write			
5	Small RDMA SEND			
6	Large RDMA SEND			
7	Small RDMA Verify			
8	Large RDMA Verify			

Results Table 16 - TI RDMA Stress Tests

Test #	Test	Pass	Fail	Comment	4
1	Switch Load				6
2	Switch Fan In				7
		l			

Table 17 - RSockets

Test #	Test	Pass	Fail	Comment	
1	Socket calls				
2	Asynchronous calls				
3	Blocking calls				
4	Non-blocking calls				
5	Verified transfers				

16.4 OPEN MPI TEST RESULTS

	Results Table 18	- 11 MIPI	*		
Test #	Test Suite	Pass	Fail	Comment	
	Phase 1:	"Short"	tests		
2	OMPI built with OpenFabrics support				
3	OMPI basic functionality (hostname)				
4.1	Simple MPI functionality (hello_c)				
4.2	Simple MPI functionality (ring_c)				
5	Point-to-point benchmark (NetPIPE)				
6.1.1	Point-to-point benchmark (IMB PingPong multi)				
6.1.2	Point-to-point benchmark (IMB PingPing multi)				
	Phase 2:	"Long"	tests		
6.2.1	Point-to-point benchmark (IMB PingPong)				
6.2.2	Point-to-point benchmark (IMB PingPing)				
6.2.3	Point-to-point benchmark (IMB Sendrecv)				
6.2.4	Point-to-point benchmark (IMB Exchange)				
6.2.5	Collective benchmark (IMB Bcast)				
6.2.6	Collective benchmark (IMB Allgather)				
6.2.7	Collective benchmark (IMB Allgatherv)				
6.2.8	Collective benchmark (IMB Alltoall)				
6.2.9	Collective benchmark (IMB Reduce)				
6.2.10	Collective benchmark (IMB Reduce_scatter)				
6.2.11	Collective benchmark (IMB Allreduce)				
6.2.12	Collective benchmark (IMB Barrier)				
6.3.1	I/O benchmark (IMB S_Write_Indv)				
6.3.2	I/O benchmark (IMB S_IWrite_Indv)				
6.3.3	I/O benchmark (IMB S_Write_Expl)				
6.3.4	I/O benchmark (IMB S_IWrite_Expl)				
6.3.5	I/O benchmark (IMB P_Write_Indv)				
6.3.6	I/O benchmark (IMB P_IWrite_Indv)				

Results Table 18 - TI MPI - Open MPI

Test #	Test Suite	Pass	Fail	Comment
6.3.7	I/O benchmark (IMB P_Write_Shared)			
6.3.8	I/O benchmark (IMB P_IWrite_Shared)			
6.3.9	I/O benchmark (IMB P_Write_Priv)			
6.3.10	I/O benchmark (IMB P_IWrite_Priv)			
6.3.11	I/O benchmark (IMB P_Write_Expl)			
6.3.12	I/O benchmark (IMB P_IWrite_Expl)			
6.3.13	I/O benchmark (IMB C_Write_Indv)			
6.3.14	I/O benchmark (IMB C_IWrite_Indv)			
6.3.15	I/O benchmark (IMB C_Write_Shared)			
6.3.16	I/O benchmark (IMB C_IWrite_Shared)			
6.3.17	I/O benchmark (IMB C_Write_Expl)			
6.3.18	I/O benchmark (IMB C_IWrite_Expl)			
6.3.19	I/O benchmark (IMB S_Read_Indv)			
6.3.20	I/O benchmark (IMB S_IRead_Indv)			
6.3.21	I/O benchmark (IMB S_Read_Expl)			
6.3.22	I/O benchmark (IMB S_IRead_Expl)			
6.3.23	I/O benchmark (IMB P_Read_Indv)			
6.3.24	I/O benchmark (IMB P_IRead_Indv)			
6.3.25	I/O benchmark (IMB P_Read_Shared)			
6.3.26	I/O benchmark (IMB P_IRead_Shared)			
6.3.27	I/O benchmark (IMB P_Read_Priv)			
6.3.28	I/O benchmark (IMB P_IRead_Priv)			
6.3.29	I/O benchmark (IMB P_Read_Expl)			
6.3.30	I/O benchmark (IMB P_IRead_Expl)			
6.3.31	I/O benchmark (IMB C_Read_Indv)			
6.3.32	I/O benchmark (IMB C_IRead_Indv)			
6.3.33	I/O benchmark (IMB C_Read_Shared)			
6.3.34	I/O benchmark (IMB C_IRead_Shared)			
6.3.35	I/O benchmark (IMB C_Read_Expl)			
6.3.36	I/O benchmark (IMB C_IRead_Expl)
